

Specific Composite Numbers Consist of Infinitely Many Arithmetic Progressions.

park ,jongsoo
oofbird7@naver.com

abstract. Ben Green and Terence Tao showed that for any positive integer k , there exist infinitely many arithmetic progressions of length k consisting only of prime numbers. [14] Four parallel proofs of Szemer'edi's theorem have been achieved; one by direct combinatorics, one by ergodic theory, one by hypergraph theory, and one by Fourier analysis and additive combinatorics. Even with so many proofs, Professor T. Tao points out that with this problem, there remains a sense that our understanding of this result is incomplete; for instance, none of the approaches were powerful enough to detect progressions in the primes, mainly due to the sparsity of the prime sequence. [22] Oliver Lonsdale Atkin introduced a prime sieve using irreducible binary quadratic forms and modular arithmetic; the algorithm enumerates representations of integers by certain binary quadratic forms. A way that uses modular arithmetic is widely known: $6n + \delta$, $12n + \delta$, $30n + \delta$, $60n + \delta$.[31] In this paper, we assert that the composite number of the $12n + 1, 5, 7, 11$ series as selected by a Modular Arithmetic and Multiplication Table are not random but consist of very structural and regular arithmetic progression groups.

1. Introduction

Look through a list of prime numbers and you'll find that it's impossible to predict when the next prime will appear. The list seems chaotic, random, and offers no clues as to how determine the next number. It is hard to guess at a formula that could generate this kind of pattern. In fact, this procession of primes resembles a random succession of numbers much more than it does a nice orderly pattern. [8] [21]

This paper starts from the question of "Can we express prime numbers and recognize them spatially such as Prime Spiral?" The prime spiral, also known as Ulam's spiral, is a plot in which the positive integers are arranged in a spiral, with primes indicated in some way along the spiral.

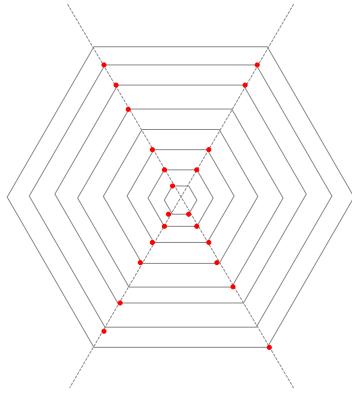

Figure – 1) Prime numbers are aligned to X-shape of 4 groups with a period of $12n$.(except 2, 3)

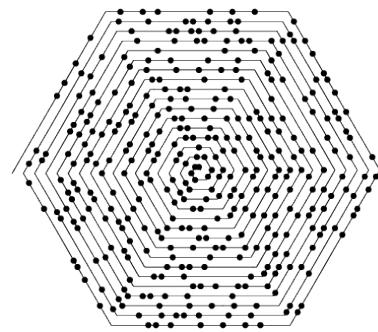

Figure – 2) A hexagonal prime spiral can also be constructed, as illustrated above (Abbott 2005, wolfram).

1.1. Primes in Modular Arithmetic

If a and d are integers, with d non-zero, then a remainder is an integer r such that $a = qd + r$ for some integer q , and with $0 \leq |r| < |d|$.[46] Putting prime numbers on the regular hexagon, every prime number except 2 and 3 is contained in the $12n+1, 5, 7, 11$ series, is sorted into 4 kinds of remainder groups—1, 5, 7, and 11—and belongs to at least one of these 4 groups.

1.2 Primes in Arithmetic Progression

Dirichlet's theorem, states that for any two positive coprime integers a and d , there are infinitely many primes of the form $a + nd$, where $n \geq 0$. In other words: there are infinitely many primes which are congruent to a modulo d . The numbers of the form $a + nd$ form an arithmetic progression [37]

$$a, a+d, a+2d, a+3d, \dots a+nd$$

and Dirichlet's theorem states that this sequence contains infinitely many prime numbers.[33] Szemerédi's theorem generalizes the statement of van der Waerden's theorem. A theorem of Szemerédi asserts that all subsets of the integers with positive upper density will contain arbitrarily long arithmetic progressions. [22] Also any given arithmetic progression of primes has a finite length. Green-Tao settled an Szemerédi' conjecture by proving the Green-Tao theorem (The primes contain arbitrarily long arithmetic progressions). It follows immediately that there are infinitely many AP- k for any k (integer $k \geq 3$, an AP- k (also called PAP- k) is k primes in arithmetic progression) [23]

2. The Specific Composite Numbers of the $12n+1, 5, 7, 11$ series

Like prime numbers, composite numbers appear intuitively irregular and seem to be difficult to group into a pattern. But, the specific composite numbers are generated by a certain rule and that rule is that composite

numbers consist of sixteen arithmetic progression groups of different lengths; each group and each arithmetic progression included in that group forms that rule.

$$25 = 5 \times 5, \quad 35 = 5 \times 7, \quad 49 = 7 \times 7, \quad 55 = 5 \times 11, \quad 65 = 5 \times 13, \quad 77 = 7 \times 11,$$

$$85 = 5 \times 17, \quad 95 = 5 \times 19, \quad 115 = 5 \times 23, \quad 119 = 7 \times 17$$

2.1 Generating the Composite Number of the $12n+1, 5, 7, 11$ series

Let us denote the set A_n is all elements of the $12n+1, 5, 7, 11$ series ($n=0, 1, 2, \dots$); the set P_n is all elements of prime numbers as comprised in A_n ; the set C_n is all elements of composite numbers as comprised in A_n

1	2	3	4	5	6	7	8	9	10	11	12
13	14	15	16	17	18	19	20	21	22	23	24
25	26	27	28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45	46	47	48

85	86	87	88	89	90	91	92	93	94	95	96
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
12n+1	12n+2	12n+3	12n+4	12n+5	12n+6	12n+7	12n+8	12n+9	12n+10	12n+11	12n+12

Table – 1) All elements of the $12n+1, 5, 7, 11$ series are not multiples of 2 and 3. Therefore, all prime numbers except 2 and 3 are contained in the $12n+1, 5, 7, 11$ series. The number in the box denotes the elements of C_n .

Theorem 1.1) All prime numbers but 2 and 3 exist in forms of $12n+1, 5, 7, 11$ with a period of $12n$.

Proof A)

(i) All natural numbers can be represented with a period of 12.

(ii) All even numbers but 2 are not prime numbers

Elements of $12n+2, 4, 6, 8, 10, 12$ are all even. ($n = 0, 1, 2, \dots, n$)

Therefore, all $12n+2, 4, 6, 8, 10, 12$'s but 2 are not prime numbers.

(iii) All $12n+3$'s but 3 are not prime numbers.

$12n+3 = (3 \times 4)n + 3$ is a multiple of 3.

(iv) $12n+9$ is not a prime number.

$12n+9 = (3 \times 4)n + 9$ is a multiple of 3.

As in Theorem 1), every prime number but 2 and 3 is contained in the periodic A_n . So, let us denote this series as follows:

$$A_n = \begin{cases} A_1, & \text{if remainder } \equiv 1 \pmod{12} \\ A_5, & \text{if remainder } \equiv 5 \pmod{12} \\ A_7, & \text{if remainder } \equiv 7 \pmod{12} \\ A_{11}, & \text{if remainder } \equiv 11 \pmod{12} \end{cases}$$

In [Figure – 2](#)) [Figure – 3](#)), the A_n series are multiplied infinitely and we can find 10 basics equations which falls into one of the 4 groups.

\times	A_1	A_5	A_7	A_{11}
A_1	$A_1 \times A_1$	$A_1 \times A_5$	$A_1 \times A_7$	$A_1 \times A_{11}$
A_5	$A_5 \times A_1$	$A_5 \times A_5$	$A_5 \times A_7$	$A_5 \times A_{11}$
A_7	$A_7 \times A_1$	$A_7 \times A_5$	$A_7 \times A_7$	$A_7 \times A_{11}$
A_{11}	$A_{11} \times A_1$	$A_{11} \times A_5$	$A_{11} \times A_7$	$A_{11} \times A_{11}$

[Figure – 3](#)) Multiplication Table

[Figure – 4](#)) Sign Assignments in the Multiplication Table

If we assign signs, we can summarize them as follows:

Multiplication	Sign	Equation	Remainder
$A_1 \times A_1$	$++(A_1)$	$(12x+1)(12y+1)$	$1 \pmod{12}$
$A_5 \times A_5$	$++(A_1)$	$(12x+5)(12y+5)$	$1 \pmod{12}$
$A_7 \times A_7$	$++(A_1)$	$(12x+7)(12y+7)$	$1 \pmod{12}$
$A_{11} \times A_{11}$	$++(A_1)$	$(12x+11)(12y+11)$	$1 \pmod{12}$
$A_1 \times A_5$	$-+(A_5)$	$(12x+1)(12y+5)$	$5 \pmod{12}$
$A_7 \times A_{11}$	$-+(A_5)$	$(12x+7)(12y+11)$	$5 \pmod{12}$
$A_1 \times A_7$	$--(A_7)$	$(12x+1)(12y+7)$	$7 \pmod{12}$
$A_5 \times A_{11}$	$--(A_7)$	$(12x+5)(12y+11)$	$7 \pmod{12}$
$A_1 \times A_{11}$	$+-(A_{11})$	$(12x+1)(12y+11)$	$11 \pmod{12}$
$A_5 \times A_7$	$+-(A_{11})$	$(12x+5)(12y+7)$	$11 \pmod{12}$

[Table – 2](#)) The Result List of Multiplication Table

Theorem 1.2) All elements of the $A_n \times A_n$ table multiplication are contained in set A_n .

Proof B)

$$(12x+\alpha)(12y+\beta), (\alpha, \beta \in \{1, 5, 7, 11\}) =$$

$$144xy + 12\beta x + 12\alpha y + \alpha\beta = \begin{cases} \alpha\beta \in \{1, 25, 49, 121\}, & \text{if remainder } \equiv 1 \pmod{12} \\ \alpha\beta \in \{5, 77\}, & \text{if remainder } \equiv 5 \pmod{12} \\ \alpha\beta \in \{7, 55\}, & \text{if remainder } \equiv 7 \pmod{12} \\ \alpha\beta \in \{11, 35\}, & \text{if remainder } \equiv 11 \pmod{12} \end{cases}$$

Therefore, $\alpha\beta \in \{1, 5, 7, 11, 25, 35, 49, 55, 77, 121\}$

Theorem 1.3) All elements of the A_n table multiplication are contained in the set of the $A_n \times A_n$ table multiplication.

Proof C)

For any element k of the set A_n : $k \in P_n$ or $k \in C_n$,

$$\text{if } k \text{ is} \begin{cases} P_n : P_n \times 1, k \in (12x + \alpha) \times 1 \text{ or } 1 \times (12y + \beta) \\ C_n : \begin{cases} P_n \times P_n, k \in (12x + \alpha) \times (12y + \beta) \\ P_n \times C_n, k \in (12x + \alpha) \times (12y + \beta) \\ C_n \times C_n, k \in (12x + \alpha) \times (12y + \beta) \end{cases} \end{cases}$$

Therefore, $C_n \geq 25$. Additionally, it is possible to find all values of C_n of the $12n + 1, 5, 7, 11$ series in the results of a matrix-multiplication of $A_n \times A_n$ that are greater than 5.

Figure – 2) Multiplication Table of $12n + 1, 5, 7, 11$ series

2.2 Prime Sieve

In the third century B.C., the scholar Eratosthenes came up with a simple algorithm for listing all the prime numbers up to a given N , referred to as the sieve of Eratosthenes. A standard improvement in the sieve of Eratosthenes is to enumerate values of xy not divisible by 2, 3, or 5. [30]

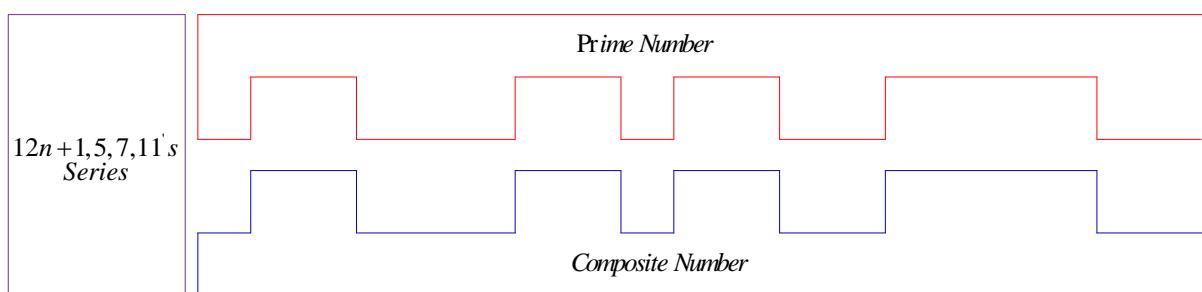

Figure 2.2.a) Prime numbers and composite numbers have complementary relationship regarding $12n + 1, 5, 7, 11$ series.

In the following [Attached document 1], the prime numbers under 1000 are being filtered using C_n . More specifically, you can see that arithmetic progressions, $Ga_n \sim Gp_n$, are intertwined. Of course, since the number of arithmetic progressions of each group increases as N increases, the complexity of intertwining of further arithmetic progressions increases. The composite numbers intuitively appear to be irregular and seem to be difficult to group into a pattern. However, the composite numbers are sorted into sixteen arithmetic groups ($Ga_n \sim Gp_n$) and are generated regularly by arithmetic progressions of each group.

2.3 The Structure of a matrix-multiplication of $A_n \times A_n$

Unlike prime numbers, which are unpredictable, the composite numbers are formed by sixteen arithmetic progression groups. This means that composite numbers in principle are predictable because whole composite numbers follow this rule. However, the composite numbers are made up of sixteen arithmetic progressions and it is difficult to see the whole of the arithmetic progressions, whose number increases, without necessary computations and information media that can store the computed results. If you can find the computed results of various arithmetic progressions intuitively, you can predict the rule that governs the composite numbers. This immediately means that you will be able to find the rule that governs the prime numbers. It is not a problem of whether or not the composite numbers are predictable but a problem of human perception.

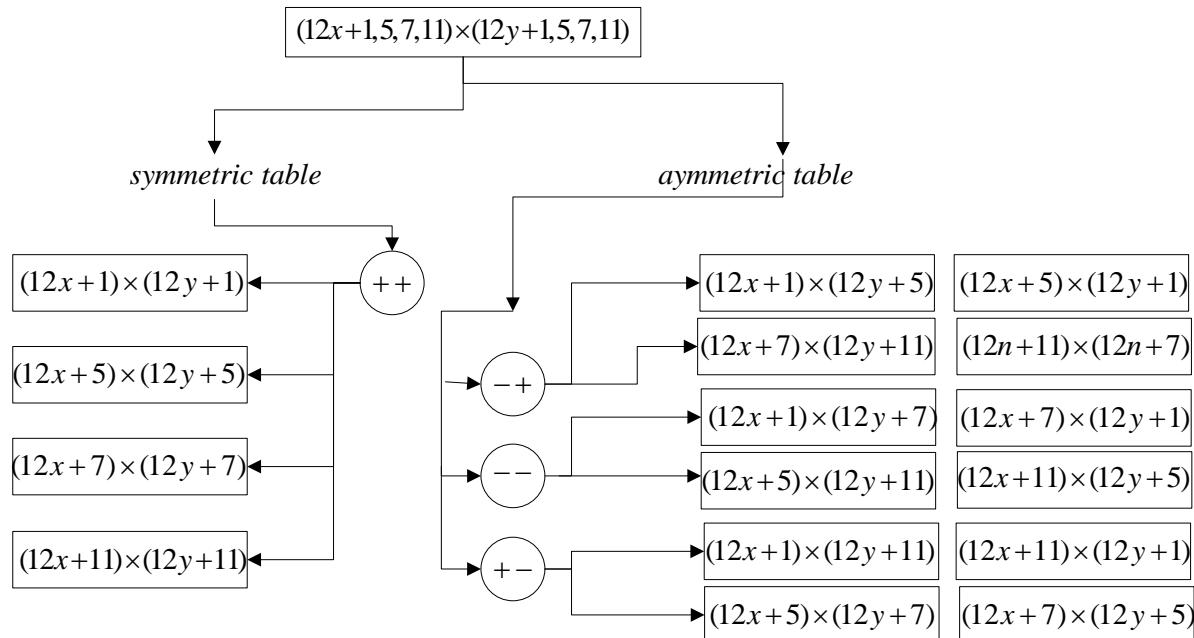

Figure – 2.3.a) Structure of Multiplication Table

- ⊗ G is a temporary mark used in this paper.
- ⊗ $a \sim p$ are marked in alphabetical order.
- ⊗ n is marked to clarify that composite numbers are a set of arithmetic progressions.

<i>N</i>	Group Name	<i>a₁</i> (first term)	<i>d</i> (common difference)	<i>n</i> =1,2,3..., <i>n</i>

13	Gm_n	$(12x+1)(12y+11)$	$12 \times (12x+1)$	$x=n, y=n-1$
14	Gn_n	$(12x+11)(12y+1)$	$12 \times (12x+11)$	$x=n-1, y=n$
15	Go_n	$(12x+5)(12y+7)$	$12 \times (12x+5)$	$x=n-1, y=n-1$
16	Gp_n	$(12x+7)(12y+5)$	$12 \times (12x+7)$	$x=n-1, y=n-1$

Table – 3) The composite numbers of the $12n+1, 5, 7, 11$ series are sorted into a total of sixteen groups($Ga_n \sim Gp_n$).

2.4 Symmetric table and Asymmetric table

Analyzing the table of the $12n+1, 5, 7, 11$ series, by the values of horizontal axis(α) and vertical axis(β), the table divides into a symmetric table if $\alpha = \beta$, and into an asymmetric table if $\alpha \neq \beta$. Therefore, we can find the following results.

i) Symmetric table, $\alpha = \beta$

$$\begin{aligned} & (12x+1) \times (12y+1), \quad (x, y \geq 1) \\ & (12x+5) \times (12y+5), \\ & (12x+7) \times (12y+7), \\ & (12x+11) \times (12y+11) \end{aligned}$$

Since $\alpha = \beta$, the results are the same, reflecting along the diagonal elements independent of the orders of α and β . So, the symmetric table has four cases.

ii) Asymmetric table, $\alpha \neq \beta$

$$\begin{aligned} & (12x+1) \times (12y+5), \quad (x \geq 1), \quad (12x+7) \times (12y+11) \\ & (12x+1) \times (12y+7), \quad (x \geq 1), \quad (12x+5) \times (12y+11) \\ & (12x+1) \times (12y+11), \quad (x \geq 1), \quad (12x+5) \times (12y+7) \end{aligned}$$

However, the commutative law does not hold if $\alpha \neq \beta$. So, depending on the orders of α and β , the results are different for the diagonal elements. An asymmetric table has twelve cases.

α	β	Sign	Equation
1	5	-+	$(12x+1) \times (12y+5)$, ($x \geq 1$)
5	1	-+	$(12x+5) \times (12y+1)$, ($x \geq 1$)
7	11	-+	$(12x+7) \times (12y+11)$
11	7	-+	$(12x+11) \times (12y+7)$
1	7	--	$(12x+1) \times (12y+7)$, ($x \geq 1$)
7	1	--	$(12x+7) \times (12y+1)$, ($x \geq 1$)
5	11	--	$(12x+5) \times (12y+11)$
11	5	--	$(12x+11) \times (12y+5)$
1	11	+-	$(12x+1) \times (12y+11)$, ($x \geq 1$)
11	1	+-	$(12x+11) \times (12y+1)$, ($x \geq 1$)
5	7	+-	$(12x+5) \times (12y+7)$
7	5	+-	$(12x+7) \times (12y+5)$

Table – 4) The Equation of Asymmetric Table

The composite numbers of the $12n+1, 5, 7, 11$ series divide into a total of sixteen arithmetic progression groups in the matrix multiplication, $(12x+\alpha) \times (12y+\beta)$, ($\alpha, \beta = 1, 5, 7, 11$), depending on $\alpha = \beta$ and $\alpha \neq \beta$.

3. Composites in Arithmetic Progression

Figure 3.1.b) We have listed the symmetric matrix results for each arithmetic progression. (a_1 =first term, d =common difference)

$Ga_1 : a_1 = (12x+1)(12y+1) = 169, \quad d = 12 \times (12x+1) = 156, (x=1, y=1)$
$Ga_2 : a_1 = (12x+1)(12y+1) = 625, \quad d = 12 \times (12x+1) = 300, (x=2, y=2)$
$Ga_3 : a_1 = (12x+1)(12y+1) = 1369, \quad d = 12 \times (12x+1) = 444, (x=3, y=3)$
$Ga_4 : a_1 = (12x+1)(12y+1) = 2401, \quad d = 12 \times (12x+1) = 588, (x=4, y=4)$
$Ga_5 : a_1 = (12x+1)(12y+1) = 3721, \quad d = 12 \times (12x+1) = 732, (x=5, y=5)$
$Ga_6 : a_1 = (12x+1)(12y+1) = 5329, \quad d = 12 \times (12x+1) = 876, (x=6, y=6)$
$Ga_7 : a_1 = (12x+1)(12y+1) = 7225, \quad d = 12 \times (12x+1) = 1020, (x=7, y=7)$
$Ga_8 : a_1 = (12x+1)(12y+1) = 9409, \quad d = 12 \times (12x+1) = 1164, (x=8, y=8)$
\vdots
$Ga_n : a_1 = (12x+1)(12y+1) = 144xy + 12x + 12y + 1, \quad d = 12 \times (12x+1), (x=n, y=n)$

Figure 3.1.c Table multiplication results are arithmetic progressions that have initial terms and common differences and have a general formula. (a_1 = first term, d = common difference)

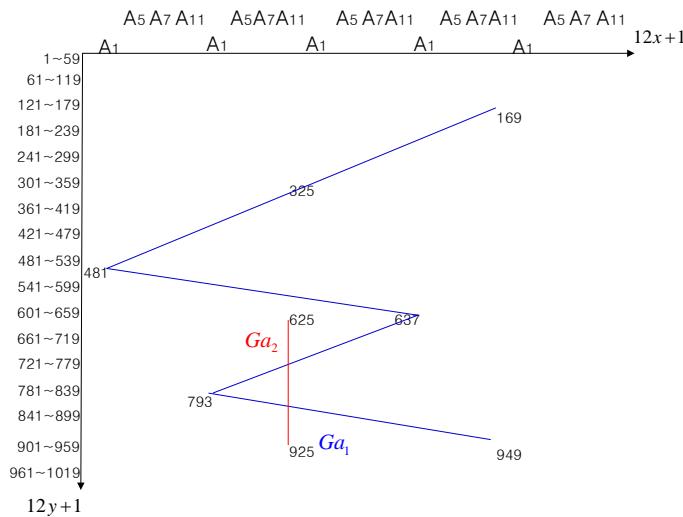

Figure 3.1.d The contour of the arithmetic progression that belongs to Ga_n

The *Figure 3.1.d*) shows the contour of the arithmetic progression, cutting by 60 up to 1000. If N increases, more arithmetic progressions are generated. A point to note here is that they appear as different contours because they have different initial terms and common differences that belong to Ga_n .

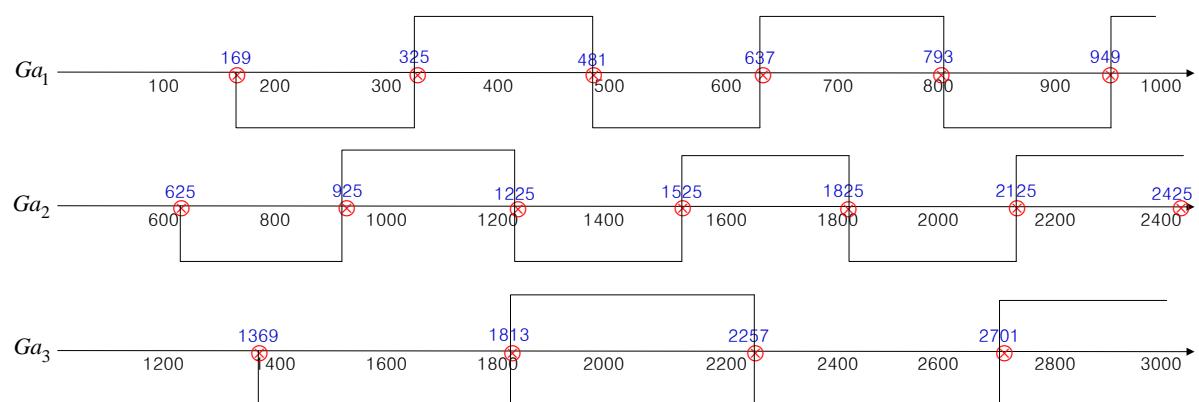

Figure 3.1.e In Ga_n , there exist, under rules, a number of arithmetic progressions that have different initial terms and

common differences.

$Ga_1, Ga_2, Ga_3 \sim Ga_n$ make up arithmetic progression groups that have initial terms, $(12x+1)(12y+1), (x, y = n)$ and common differences, $12(12x+1), (x = n)$. Of course, as n increases, the values of the initial term and the common difference increase.

N	<i>current value</i>	<i>new value</i>
$Ga_1 : a_1(169)$	Ga_1	Ga_1
$Ga_2 : a_1(625)$	Ga_1, Ga_2	Ga_2
$Ga_3 : a_1(1369)$	Ga_1, Ga_2, Ga_3	Ga_3
$Ga_4 : a_1(2401)$	Ga_1, Ga_2, Ga_3, Ga_4	Ga_4
$Ga_5 : a_1(3721)$	$Ga_1, Ga_2, Ga_3, Ga_4, Ga_5$	Ga_5
\vdots	\vdots	\vdots
$Ga_n : a_1$	$Ga_1, Ga_2, Ga_3, Ga_4, Ga_5, \dots, Ga_n$	Ga_n

Figure 3.1.f) As the natural number N , increases, new arithmetic progressions accumulate and keep increasing.

In *Figure 3.1.f)*, since new arithmetic progressions accumulate as the natural number N increases, the distribution density of the composite numbers in each region becomes high. For example, the number of composite numbers of the arithmetic progression, Ga_n , is higher in the 1,000-2,000 region than in the 11,000-12,000 region. Just like a timer that rings after a certain period of time, for a certain N , the corresponding arithmetic progression operates.

Theorem 2) As N increases, the density of composite numbers becomes higher. In other words, it means that, as N increases, prime number density becomes low. (of the sparsity of the prime sequence.)

When writing the list of prime numbers, you will find that prime numbers become more and more sparse.

n	$\pi(n)$	$\pi(n) / n$
10	4	0.4
10^2	25	0.25
10^3	168	0.168
10^4	1,229	0.1229
10^5	9,592	0.09592
10^6	78,498	0.078498
10^7	664,579	0.066458
10^8	5,761,455	0.057615
10^9	50,847,534	0.050848
10^{10}	455,052,512	0.045505

Table – 5) The Sparse of Prime Numbers

The number of prime numbers between 1 and 100 is greater than that between 101 and 200. There are 4 prime numbers (40%) between 0 and 10, 25 prime numbers (25%) between 0 and 100, 168(16.8%) between 0 and 1000, 1,229 (12.3%) between 0 and 10000, 9592 (9.5%) between 0 and 100000, and 78,498 (7.8%) between 0 and 1000000. The percentage gradually decreases. [9][10]

Section	The count of prime	The count of composite	Total
$0 \sim 10^2$	25(0.25)	9(0.09)	34
$10^2 \sim 2 \times 10^2$	21(0.21)	13(0.13)	34
$2 \times 10^2 \sim 3 \times 10^2$	16(0.16)	17(0.17)	33
$3 \times 10^2 \sim 4 \times 10^2$	16(0.16)	17(0.17)	33
$4 \times 10^2 \sim 5 \times 10^2$	17(0.17)	17(0.17)	34
$5 \times 10^2 \sim 6 \times 10^2$	14(0.14)	19(0.19)	33
$6 \times 10^2 \sim 7 \times 10^2$	16(0.16)	17(0.17)	33
$7 \times 10^2 \sim 8 \times 10^2$	14(0.14)	20(0.20)	34
$8 \times 10^2 \sim 9 \times 10^2$	15(0.15)	18(0.18)	33
$9 \times 10^2 \sim 10^3$	14(0.14)	19(0.19)	33

Table – 6) Densities of Prime and Composite Numbers in Each Region

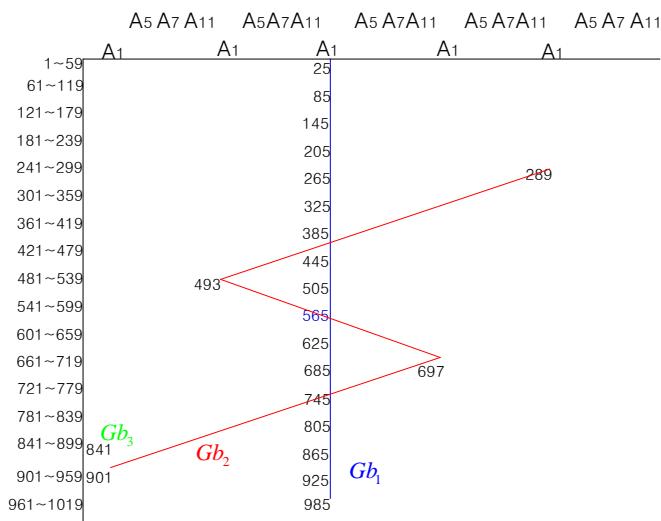

Therefore, if you know reason that the number of composite numbers increases, you will know why prime number density decreases. This is because, at least, we know the rules under which composite numbers are generated. This phenomenon is a natural result because new arithmetic progressions accumulate as a natural number, N , increases. As Ga_n , Gb_n , $Gc_n \sim Gp_n$ make up groups that all have different initial terms and common differences. Therefore, they make up sixteen groups of arithmetic progressions.

4. Conclusion

This paper asserts that the composite numbers of the $12n + 1, 5, 7, 11$ series make up sixteen arithmetic progression groups. We were able to indirectly deduce the uncertainty of prime numbers through the composite numbers. It is true that, unlike the prime numbers, the composite numbers are governed by a rule that is structural and regular.]

Acknowledgements

I am very grateful to Professor Youn, cheong and to Lim, sang-tae for their advice and for the patience they showed, assisting me.
