## Title: A top-down approach to fundamental interactions

#### Abstract

This paper proposes that the Standard Model [4] [5] and Einstein's general relativity theory can be unified by introducing probabilities similar to the field of information theory developed by Claude Shannon [16] and others. Accurate estimates regarding the number of neutrons in the universe are now available due to the WMAP [8] project. The author noted that there are approximately the natural number e (2.71828) to the power $180(\exp (\mathrm{~N}))$ protons in the universe (Technical endnote 1) and explored the possibility that the number is fundamental to physics. Considering the probability of one neutron as 1/exp(180) a "top-down" model lead to a direct calculation of the gravitational constant and a uniform method of evaluating fundamental forces.

## Methodology

Information theory and thermodynamics define probability P and uncertainty S as shown in the following table. The terminology and methodology involves the use of the natural $\log (\mathrm{ln})$. This proposal will seek meaningful quantities associated with N , where N will be derived from the value 180. Subsequently the relationship $\mathrm{E}=\mathrm{e} 0 \exp \mathrm{~N}$ will be used to give energy after the pre-exponential can be clearly defined. The current Standard Model is based on symmetries [5][12]. The author explores symmetries that are information theory operations on the logarithms $\mathrm{N}=180, \mathrm{~N}=90$, etc. and related to probabilities by the equation $\mathrm{P}=1 / \exp (\mathrm{N})$. Information theory probability and energy are defined together [13] as follows: As an energy ratio E/e0 increases, probability decreases to retain $\mathrm{E} / \mathrm{e} 0 * \mathrm{P}=1$.

Modern physics accurately describes many aspects of nature but requires the insertion of many constants. The Standard Model [4][5] makes the Higgs energy the source of particle mass but its energy has not been verified experimentally. A proposed value for the Higgs energy is derived from the number 90 and its energy is calculated from measurable quantities.

## Operations 1, 2, 3, 4, 5 and the Higgs

The work below is a result of "cracking nature's code". Eight information operations were discovered, the first of which is simply, divide the number 90 by 4 to give four
values of 22.5 each. The author associates these values with what will be called the Higgs N value (see Technical endnote 1 under the column entitled N ). The author also associates these values with four equal dimensions.

|  |  |  |  |  |  | Probability |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Operation 1 | Operation 2\&3 | Operation 4 | Operatior | Fundamenta | $\mathrm{P}=1 / \exp (\mathrm{N})$ |
| Higgs X dimension | 22.5 | $\longrightarrow 10.167$ | 4.167 | $\longrightarrow 15.333^{\circ} 0.0986$ | $\longrightarrow 15.432$ | $1.99 \mathrm{E}-07$ |
|  |  | $\longrightarrow 12.333$ |  | 12.333 - 0.0986 | $\longrightarrow 12.432$ | 3.99E-06 |
| Higgs Y dimension | 22.5 | $\longrightarrow 10.167$ | 13.167 | $\longrightarrow 13.333^{*} /{ }^{\text {r }}$ | $\longrightarrow 13.432$ | $1.47 \mathrm{E}-06$ |
|  |  | $\longrightarrow 12.333$ |  | 12.333 | $\longrightarrow 12.432$ | $3.99 \mathrm{E}-06$ |
| Higgs Z dimension | 22.5 | $\longrightarrow 10.167$ | $3.167$ | $\longrightarrow 13.333^{*} 0.0986$ | $\longrightarrow 13.432$ | $1.47 \mathrm{E}-06$ |
|  |  | $\longrightarrow 12.333$ |  | 12.3330 .0986 | $\longrightarrow 12.432$ | 3.99E-06 |
|  |  | 0.667 | IV | $0.667 \rightarrow 0.0750$ | 0.075 | $9.28 \mathrm{E}-01$ |
| Time | 22.5 | 11.500 |  |  |  |  |
|  |  | 10.333 |  | 10.333 | 10.333 | $3.25 \mathrm{E}-05$ |
| Total | 90 | 90 |  | 90 | 90 | $8.19 \mathrm{E}-40$ |

The third, fourth and fifth operations are arithmetic operations on the number 90 as shown in the table above. The number 0.666 in the second column above is related to charge as indicated in operation. The author will show how the numbers in the table specify parts of the neutron. After each operation, the number 90 is maintained as the sum. Each part has a probability $1 / \exp (\mathrm{N})$ associated with it and the total probability $1 / \exp (90)=8.194 \mathrm{e}-40$ is the multiple of these probabilities.

## Operation 6 Energy

The numbers $15.43,13.43$ and 13.43 will be associated with sub-particles in the neutron/proton and the author found meaningful energies associated these numbers. That association is found with the number $10.333-3 * 0.0986=10.136$. The number 10.136 represents the electron. Data label PDG in this document is from the Particle Data Group [4].

```
e0=E/exp(N)
    Find the value e0 by solving the above equation with E=.511 e0=0.511/exp(10.136)
    Electron mass (mev) mass of electron (mev) 0.51099892 mev
                        (best value from PDG) 0.510998918 mev 2.025E-05 mev
Note that 3*.0986=.296 0.296 E=eo*exp(.2958)=2.72e-6 mev 2.722E-05 mev
The electric field energy of the electron is known to be: 2.72E-05 mev
```

All subsequent energies are evaluated with the constant e0: i.e. $\mathrm{E}=\mathrm{eo}^{*} \exp (\mathrm{~N})$, where $\mathrm{e} 0=2.025 \mathrm{e}-5 \mathrm{mev}$. The Higgs energy can be determined with the equation $\mathrm{E}=2.025 \mathrm{e}-$ $5^{*} \exp (22.5)=119671 \mathrm{mev}$. This value for the Higgs published on July 42012 is 125300 and was within the range identified [5].

## Operation 7 Energy interaction

The author calls operation 7 an "energy interaction". Operations 2, 3 and 4 created four sets of numbers and the set identified as $\mathrm{N}=13.431$ and $\mathrm{N}=12.431$ will be used below for demonstration. The energy interaction adds the number 2 to 13.431 to give 15.431 while at the same time, the number 2 is subtracted from 12.431 to give 10.431. Each number in the interaction has a specific place and a specific meaning described below:

E1 will be identified as a mass (a quark for the strong interaction)
E 2 is identified as a kinetic energy (ke) addition to energy E1.
E3 is identified as field energy (strong potential energy for this N ).
E4 is identified as a gravitational energy component.
The total energy across the interaction is conserved at zero with mass (E1) + ke (E2) +ke difference (E4+E3-E2-E1) balancing field energies (E3+E4 shown as negative). Values are placed in a table to the right of the basic interaction.

This energy interaction has powerful implications resulting from the addition and subtraction of the number 2. The interaction creates orbits based on $\mathrm{E}=\mathrm{ke}$ and are special case Lagrangians (technical endnote 2). The interaction involving E1 can be read E1 is given $\exp (2)$ of energy to become E3. Since the numbers (N) are exponents (recall that $\mathrm{E}=\mathrm{eo} \exp (\mathrm{N})$ ), the number 2 can be associated with a fractional divisor for the original energy. The number 2 is evaluated as $1 / \exp (2)=0.135$. After the interaction, energy 13.78 mev becomes 101.947 mev since $13.79 / 0.135=101.947 \mathrm{mev}$. This is identical to the concept of gamma in relativity. Gamma is the fractional divisor that increases the kinetic energy of a fast moving mass involved in the Lorentz transformation. The definition required is: $\mathrm{ke}=\mathrm{m} / \mathrm{gamma}-\mathrm{m}$.
Operation 2 proposed that the Higgs N value is associated with each of four dimensions. Three of the dimensions are distance (think $\mathrm{x}, \mathrm{y}, \mathrm{z}$ ) while the other dimension is time ( t ). Gamma is a measure of how far mass moves into the time dimension while distance changes by an incremental amount due to kinetic energy. Since the dimensions are equal, $\mathrm{x} / \mathrm{t}$ is a constant (C, the speed of light). Furthermore, the dimensions are orthogonal, meaning that they cross each other at right angles ( 90 degrees). The above information leads to the famous Einstein energy momentum relationship [13]. (Etotal^2 ${ }^{\wedge}$ Emass ${ }^{\wedge} 2+(\mathrm{pC})^{\wedge} 2$, where p is momentum).

## Operation 8 Waves

Wave/particle duality is fundamental in physics and operation 8 describes everything as waves by multiplying the probabilities and associated energies defined in operation 6 by the quantities $\exp (\mathrm{iv} \mathrm{dt})$ and $\exp (-\mathrm{iv} \mathrm{dt})$. The symbol i designates an imaginary number, v is frequency and dt is differential time. However, it is possible to maintain a simple approach by limiting our evaluation to times when $\exp (i v \mathrm{dt}) * \exp (-\mathrm{iv} \mathrm{dt})=1$. After operation 8, we can use the concept of frequency ( $\mathrm{v}=1 /$ time) and use the well known relationship $\mathrm{E}=\mathrm{Hv}$, where H is Planck's constant. Planck's constant lets us relate conventional time (sec) and energy (mev).

## The $\mathbf{R}$ equation

Technical endnote 2 shows development of the equation $\mathrm{R}=\left(\mathrm{HC} /(2 \mathrm{pi}) /\left(\mathrm{E}^{*} \mathrm{~m} / \mathrm{g}\right)^{\wedge} 0.5\right.$. This known equation for orbital radius [14] tells us that the energy interaction establishes an orbit. Mass ( m ) with velocity (gamma) orbits field energy (E) at radius R. The author calls this the R equation.

## Operation 9 The neutron

The concepts are now in place to understand the value 90 in a different way. Recall that the probability of one neutron is $\mathrm{P}=1 / \exp (90)^{*} 1 / \exp (90)$. There were 8 operations on the logarithm $\mathrm{N}=90$ that set up at least three orbits. The table below is an overall energy balance comprised of the various components of the value 90 . The mass and kinetic energy value 939.56 mev is the mass of a neutron and compared to the measurement error for a neutron in the section below entitled "Data Comparisons". We can name the energy components of the neutron using Technical endnote 1. It contains one quark of mass 101.97 mev that is called the strange quark and two quarks of mass 13.8 mev called down quarks. The quarks are in orbits around strong fields shown in the column labeled Strong Field. They have kinetic energy shown in the column labeled Difference Ke. Note that a third interaction is shown below the quarks. It adds 0.622 mev to the neutron mass, is later involved in the decay of a neutron to a proton and contributes negative energy to the right hand side of the balance. The author identifies the total energy 2.683 mev as the gravitation field energy. The kinetic energy $20.3 \mathrm{mev}(4 * 5.08)$ is set aside for expansion [2]. A diagram of the neutron is shown. The three quarks are confined within a range less than $2.01 \mathrm{e}-15$ meters and contain 798.6 mev of kinetic energy. The "bundle of quarks" is held in a larger orbit with kinetic energy 10.15 mev by the field energy 20.3 mev. This field energy is a result of the overall energy balance and the force is called the strong residual force. The value of this energy is the difference between the neutron mass 939.56 mev and the (negative by convention) sum of the strong field energy 957.18 mev . The overall spin of the neutron is known to be 0.5 (spin is a measure of angular momentum) and the spin components are shown in the spin column which obeys the exclusion principal disallowing two down quarks to be one orbit unless they have opposite spin). The overall charge of the neutron is zero and the column labeled Charge shows the components.

|  |  |  |  |  |  |  |  |  | 959.868 | -959.868 | $0.000 \mathrm{E}+00$ | 0.500 |

Note that the energy 2.02e-5 is a neutrino that carries away 0.5 spin. This allows the neutron/neutrino system to maintain overall zero spin.

The neutron decays to a proton and electron in about 881.49 seconds (PDG). The decay process starts with a separation in the interaction mentioned above containing the value $\mathrm{E}=\mathrm{e} 0 * \exp (10.33)=0.622 \mathrm{mev}$. Zero separates into minus 10.33 and plus 10.33 and the 10.33 moves outside the proton to form the base for the electron. Charge components involve another separation, zero $=3 * 0.0986-3 * 0.0986$. Recall that the electric field energy 27.2 electron volts=e $0 * \exp (0.296)$. This gives the electron and the proton their opposite but equal electrical field energies as shown in the column labeled Charge. The electron is formed by the energy interaction near the bottom of the diagram below. Nature maintains another zero. It allows an electron to be created if and only if an antiparticle in the lepton family is created. That particle is the energy $2.47 \mathrm{e}-5 \mathrm{mev}$ named the anti-electron neutrino. Physics knows of these particles because there is missing energy in known interactions. It leaves the proton along with the 0.622 mev . Another neutrino (the mu neutrino) results from the leftovers (10.33+.075-10.33) in the proton. As it leaves it takes energy $\mathrm{E}=\mathrm{e} 0 * \exp (10.408)=0.671$ mev with it. (Together 0.671 and 0.622 mev make up the energy difference between the neutron and proton ( 1.293 mev ). Again refer to measured data and compare it to the authors "model" of the proton and electron. The spin column reviews components for the proton, electron and neutrinos (all 0.5).

## Fundamental forces (interactions)

The following table follows directly from the proton model above. The proton is a manifestation of information symmetries and contains orbits that underlie some of the fundamental forces. Gravitational mass is 129.541 . Refer to the proton model above to see the source its $\operatorname{Ke}(10.151 \mathrm{mev})$ and Field Energy ( -2.683 mev ). The strong field energies of the three quarks are added together and orbit the true mass of the three quarks ( 129.541 mev ). The Standard Model identifies the weak force as the fourth fundamental force but information from the proton model involves what is called the strong residual force. The strong residual field energy ( -20.3 mev ) is the missing energy required to balance the total to zero (negative 959.868 and positive 959.868 mev ). The strong residual mass is the 129.5 true mass of the quarks plus the quark kinetic energy (799.251 mev ) because of the orbits identified in the following section. From these values, gamma and a radius ( R ) are derived. Gamma is ke/(m+ke) and R is
$\mathrm{R}=\left(\mathrm{HC} /(2 \mathrm{pi}) /\left(\mathrm{E}^{\star} \mathrm{m} / \mathrm{g}\right)^{\wedge} 0.5\right.$

## Gravitational Constant

The above information leads directly to a calculation for the gravitational constant. Physics has struggled with the reconciliation of general relativity and quantum field theory. The author believes that the energy scale for gravitation is on the order of a proton rather than the high Planck energy 1.2 e 22 mev [1]. This has misled gravitational theorists into believing that space is full of infinities and breaks into quantum foam. Another reason for difficulty is gravity's very low force and very long range effect. This proposal places a proton in nature with reduced force and extended range by multiplying it's force from the proton model by the value $1 / \exp (90)$. A small energy, by the Heisenberg uncertainty principle, will have long range.

A cosmology model is proposed [1][2][3] based on $\exp (180)$ cells, each containing a proton. Combined the cells make up the universe. General relativity uses the metric tensor ( $\left.\mathrm{ds}^{\wedge}\right) 2$. The surface area of a 2 -sphere may be broken into many small spheres with an equal surface area. Let r represent the radius of a many small spheres and R represent the same surface area of one large sphere containing $\exp (180)$ spheres. The surface of the cell contains one proton (and the center of the cell probably contains a second proton like mass). The total mass is $m * \exp (180)$. The total energy will be that of 1 (or 2) protons/cell plus a small amount of kinetic energy. This energy will be constant during expansion and the energy density at a particular time in expansion will be a constant, i.e. E/Volume=constant. We will evaluate the energy density of many small cells each with the same energy density of one large sphere.

It is known that gravity is inertial as stated by the general theory of relativity. The source of information about gravity is an orbit. The sum of true mass (mass with no kinetic energy added) in the proton model is 129.54 mev . This mass has kinetic energy 10.15 mev and is attracted to a gravitational energy of 2.683 mev . The radius (by the equation $\mathrm{R}=\left(\mathrm{HC} /(2 \mathrm{pi}) /\left(\mathrm{E}^{*} \mathrm{~m} / 1\right)^{\wedge} 0.5\right.$ is $1.056 \mathrm{e}-14$ meters. The orbital velocity is given below:

|  |  |  | GRAVITY |  |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  | mass only |
|  |  |  |  | proton+elec |
| Particle Mass (mev) |  |  | 129.541 |  |
| M (kg) |  |  | $2.309 \mathrm{E}-28$ |  |
| Field Energy (mev) |  |  | 2.683 |  |
| Kinetic Energy (mev) |  |  | 10.151 |  |
| Gamma (g)=m/(m+ke) |  | 0.9273 |  |  |
| Velocity Ratio | $\mathrm{v} / \mathrm{C}=\left(1-(\mathrm{g})^{\wedge} 2\right)^{\wedge} .5$ | 0.3742 |  |  |

| Calculation of gravitational constant from Inertial Force |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Radius R (Meters) |  |  | $1.0563 \mathrm{E}-14$ |  |  |
| Mass (kg) | (proton) |  | $1.673 \mathrm{E}-27$ |  |  |
| Inertial Force $=\left(m^{*} V^{\wedge} 2 / R\right)^{*} 1 / E X P(90)$ |  |  | $1.6275 \mathrm{E}-36$ |  |  |
| Gravitational Constant ( $\mathrm{g}=\mathrm{F}^{*} \mathrm{R}^{\wedge} 2 / \mathrm{M}^{\wedge} 2=n t \mathrm{~m}^{\wedge} 2 / \mathrm{kg}^{\wedge} 2$ ) |  |  | 6.4912E-11 |  |  |
|  |  | Proton | $6.4912 \mathrm{E}-11$ |  |  |
|  |  | End of expansion | $6.73 \mathrm{E}-11$ | 0.00858 | calculated accuracy |
|  |  | Published PDG | $6.6743 \mathrm{E}-11$ | 0.0001 | published accuracy |

Note that the best fit to the published value of gravitational constant is the proton calculation above at the end of expansion [1][2][3]. Note that definition of gravity based on this orbit gives a quantum mechanical action on the order of 1 as demonstrated below:

| $\mathrm{ke}=\mathrm{mc}^{\wedge} 2 / 2$ |  |  |  |
| :---: | :---: | :---: | :---: |
| ke=.5mc*x/t |  |  |  |
| $\mathrm{p}=\mathrm{mv}, \mathrm{x}=\mathrm{vt}$ |  |  |  |
| $\mathrm{ke}=.5 \mathrm{mc} * \mathrm{vt} / \mathrm{t}$ |  |  |  |
| $\mathrm{ke}=.5 \mathrm{pc}$ |  |  |  |
| ke (mev) | 10.15 |  |  |
| $\mathrm{p}=2 \mathrm{ke} / \mathrm{c}$ | 2*10.15/C | 6.77E-08 | $\mathrm{mev}-\mathrm{sec} / \mathrm{m}$ |
| $x$ (meters) | 1.00E-14 |  |  |
| $\mathrm{px}=2 \mathrm{ke} / \mathrm{c}^{*} \mathrm{x}$ |  | 6.77E-22 | m |
| $h r=h /\left(2^{*} \mathrm{pi}()\right)$ |  | 6.58E-22 | mev-sec |
| quantum | $p \mathrm{x} / \mathrm{hr}=1$ | 1.028038 |  |

Reference [1] compares conventional theory of the gravitational constant (Planck length $\mathrm{L}=\left(\mathrm{h} \mathrm{G} / \mathrm{C}^{\wedge} 3\right)^{\wedge} .5$ where $\mathrm{L}=1.6 \mathrm{e}-35$ meters) with the above analysis. Several arguments are presented for this low energy scale source for gravity.

## Force Table

Forces now conventionally are called interactions. The sources of information for this table are the neutron/proton orbits identified in the diagram above and the neutron/proton information model. Coupling constants to the proposed Higgs energy are shown since it appears to be at the top of the mass/energy hierarchy.

| Force Unification Table |  | cell ax74 |  | Strong total | Strong down | Strong down | Gravity | Electromagne | ng Residual |

## Comparison of force table coupling constants with published results

Energy components of the neutron model allow coupling to the Higgs energy to be clearly stated. From operations 2, 3, 4 and 5, we can identify the coupling that gives the field energies and quark energies. Numerically the couplings are ratios like $\exp (17.43) / \exp (22.5)=0.00744$ shown at the bottom of the above table. Strong coupling constants in the literature are 1.0 based on the field energies acting as exchange bosons (gluons). Calculated forces compare favorably with the conventional physics forces $=3.16 e-25 / R^{\wedge} 2$ Newtons and the derived coupling constants $c^{\wedge} 2$ compare favorably with published values (converted from Joule-sec). If the field energy 2.683 mev is divided by $\exp (90)$, the graviton energy is $1.59 \mathrm{e}-38 \mathrm{mev}$ and the range is $1.014 \mathrm{e}-$ $14 * \exp (90)=1.24 \mathrm{e} 25$ meters. Literature uses the neutral pion ( 131.5 mev above) as the exchange energy and the author's calculation for this boson is 138 mev [18]. The strong residual coupling 0.147 is verified by a binding energy curve constructed by the author based on 20.3 mev field energy [17]. A proton model orbital diagram allows accurate calculations to be made regarding the electromagnetic force. With a low correction to the electromagnetic field energy due to shielding, the Rydberg constant, coupling constant and electric constant agree with published values (PDG).

Exchange bosons and quantum mechanical probability:
The quantum mechanical probability (action) is equal to $m x^{\wedge} 2 / t$ divided by Planck's reduced constant ( m and x come from the Force Table above and t is the time to travel across x at $\mathrm{V} / \mathrm{C}$ ). The calculated action was almost exactly 1 in all cases. The current concept of gauge forces utilizes bosons moving at velocity C and exchanging inertia to explain action at a distance. For example the strong residual energy is described historically by the Yukawa potential and a pion exchange particle. It appears that the boson mass is "back calculated" as shown in the table above for velocity C although the actual mass and actual velocity from the proton model give the correct action. One of the difficulties with gravity is that a different explanation is offered for action at a distance because the distances are often large even at the speed of light. It is often stated that mass bends space-time and particles follow curved space. The author believes that all four forces operate the same way and that space-time is truly shaped by mass, gamma and field energy (the R equation). The reason gravity is long range is the divisor $1 / \exp (90)$. If space is curved enough an orbit is established, not only for gravity but for all the forces. The field, mass and velocity carried by the particle gives its contribution to spacetime curvature. That is, when we write the equation for gravitational force $=g * M m / R^{\wedge} 2$ or electromagnetic force $=1 /(4 \mathrm{pi})^{*} 0^{*} \mathrm{qq} / \mathrm{R}^{\wedge} 2$ we are describing space time curvature for the combination of energies.

## Summary

Introducing information theory probabilities into physics can reconcile the Standard Model and general relativity at the quantum level for gravity. The author believes that nature's underlying laws are information laws based on the large number $\exp (180)$. The neutron, proton and the number of protons are manifestations of the underlying law and are sources of information for the four forces. This paper appears to decode some of the information laws applicable to well documented particles. A unified theory must meet
other criteria to be of value. The neutrinos, electron, muon, tao, mesons and baryons should also be manifestations of the underlying laws. Although beyond the scope of this document, the author found a progression of energies underlying these particles [3]. The binding energy curve should also be explained by the theory and this is successfully demonstrated [17]. In addition a unified theory will also be fundamental to the field of cosmology. The R equation used throughout this document was modified by replacing gamma with another time ratio in the denominator, giving what the author believes is the correct expansion equation for the universe [2][3][13]. This does not contradict WMAP data since the expansion curves match. However, the new approach suggests that dark energy is a misconception related to misuse of the critical density concept [3]. Combined with the author's study of mesons and baryons it is possible that dark matter consists of particles with the mass of a neutron that only couples with gravity.

## Technical endnote 1 Particle review and number of neutrons

The above table strongly suggests an exponential relationship in energy for the fundamental particles. The proposed N values compare favorably with data from various sources and $\sin ^{\wedge} \wedge$ theta agrees with Erler [5] figure 10.1 at low energy.

## Number of neutrons

The best data is from the recent WMAP project reported [8] and the Supernova Cosmology Project [11]. Recent data indicate that there are two components to expansion [8] [11]. Critical density [9] has been used historically to predict the size of the universe and early equations like the Friedmann equation [6][7][9][10] give expansion predictions. There are questions regarding components of the critical density WMAP [8] but data indicates that 0.27 of the value represents mass, comprising dark and
light particles. For purposes of estimating the number of particles half are assumed to have mass of a neutron ( $1.675 \mathrm{e}-27 \mathrm{~kg}$ ).

Note: units used in this document are kilograms ( kg ), meters (M), newtons (nt), seconds ( sec ) and million electron volts (mev).

| Critical Density (kg/M^3) | R final-M | N particles | $\ln (N)$ |  |

| $9.50 \mathrm{E}-27$ WMAP basic results Table 3 | $7.18 \mathrm{E}+25$ | $1.19 \mathrm{E}+78$ | 179.78 |  |
| N particles $=4 / 3^{*} \mathrm{Pl}()^{*}$ Rfinal $^{\wedge} 3^{*} 0.27^{*} 9.5 \mathrm{e}-27 / 1.675 \mathrm{E}-27 / 2$ |  |  |  |  |

## Technical endnote 2 The $\mathbf{R}$ equation and Lagrangian

There is a circle associated with the concept of frequency. One (1) divided by frequency is the time required for a wave at velocity C to move around the circumference of the circle. The table below gives us the radius of the circle in terms of H and E . This circle also allows us to relate the energy interaction of operation 7 to an orbital radius R. The radius is $1.93 \mathrm{e}-15$ meters when the field energy $\mathrm{E}=101.947 \mathrm{mev}$ is put into the equation $\mathrm{R}=(\mathrm{HC} / 2 \mathrm{pi}) / \mathrm{E}$. Because 101.947 mev is also equal to $13.79 / 0.135$ and 0.135 is gamma, $E$ is also equal to $\mathrm{m} / \mathrm{g}$. The new relationship $\mathrm{R}=\left(\mathrm{HC} /(2 \mathrm{pi}) /\left(\mathrm{E}^{*} \mathrm{~m} / \mathrm{g}\right)^{\wedge} 0.5\right.$ (mass with velocity orbits a field at radius R ) tells us that the energy interaction establishes an orbit because this equation is a known equation [14]. This orbit is established and maintained by the energy interaction. The last part of the following table demonstrates the relationships with values from operation 7. The author is aware that because of particlewave duality only a probabilistic determination of radius is possible and it is noted that all results using these radii are probabilistic in nature.

| The time for one cycle of the wave is $2^{*} \mathrm{pi*} R / C$ since the wave moves at $C$ ( $R$ is the radius of a circle). |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2^{*} \mathrm{pi}^{*} \mathrm{R} / \mathrm{C}=1 /$ frequency |  |  |  |  |  |  |  |  |
| 2*pi*R/C=H/E |  |  |  |  |  |  |  |  |
| Using the same example as detailed in operation 6: |  |  |  |  |  |  |  |  |
| Field energy E |  | 101.947 mev |  |  |  |  |  |  |
| 2*pi*R/C | time | $4.057 \mathrm{E}-23$ | seconds |  |  |  |  |  |
| H/E | time | $4.057 \mathrm{E}-23$ | seconds |  |  |  |  |  |
| convenient constant: |  | HC/(2*pi) |  | $1.973 \mathrm{E}-13$ | mev-meters | 1.973E-13 | pdg value |  |
| $\mathrm{R}=\mathrm{H}^{*} \mathrm{C} /\left(2^{*} \mathrm{pi}\right) / \mathrm{E}$ |  | $1.9356 \mathrm{E}-15$ | meters | $E$ in the equation to the left can also be: |  |  |  |  |
|  |  |  |  | $\mathrm{E}=\left(\mathrm{E}^{*} \mathrm{E}\right)^{\wedge} .5=\left(\mathrm{E}^{*} \mathrm{~m} / \mathrm{g}\right)^{\wedge} .5$ |  |  |  |  |
|  |  |  |  | because in the equation to the left, $\mathrm{E}=\mathrm{m} / \mathrm{g}=13.977 / .1353$ |  |  |  |  |
|  |  |  |  | $\left(E^{*} \mathrm{~m} / \mathrm{g}\right)^{\wedge} .5=\mathrm{E}=(101.947 * 13.797 / .1353)^{\wedge} .5$ |  |  |  |  |
| Substitute ( $\left.E^{*} \mathrm{~m} / \mathrm{g}\right)^{\wedge} .5$ for $E$ in the above equation to give an equation for radius involving mass, field energy and gamma. |  |  |  |  |  |  |  |  |
| $\mathrm{R}=\left(\mathrm{HC} /(2 \mathrm{pi}) /\left(\mathrm{E}^{\star} \mathrm{m} / \mathrm{g}\right)^{\wedge} 0.5\right.$ |  | This equation represents a force balanced orbit with kinetic energy 0.5 times the field energy. |  |  |  |  |  |  |
|  |  | It is also accurate for orbits determined by energy balances as demonstrated below. |  |  |  |  |  |  |
| From operation 6 definitions and the operation 6 example. |  |  |  |  |  |  |  |  |
| Field energy E |  | 101.947 | mev |  |  |  |  |  |
| $\begin{aligned} & \text { mass }(\mathrm{m}) \\ & \hline \text { ke } \end{aligned}$ |  | 13.7970 | mev |  | mass divided by g is equivalent to the field |  |  |  |
|  |  | 88.150 | mev |  | Instead of $\mathrm{g}=1 / \exp (2)$ gamma can be defined from ke |  |  |  |
| gamma (g) | $g=1 / \exp (2)$ | 0.1353 |  |  | $\mathrm{g}=\left(1-(m /(m+k e))^{\wedge} 2\right)^{\wedge} 0.5$ |  |  |  |

The author refers to the equation above for orbital radius as the R equation.
An orbit based on R is a special case of a Lagrangian as shown below:

| E=potential energy |  |
| :---: | :---: |
| KE=kinetic enrgy |  |
| Lagrangian |  |
| L=0 potential energy-kinetic energy |  |
| E=ke |  |
| 1=ke/E |  |
| 1=ke/(E*E)^. 5 |  |
| $1=\mathrm{ke} /(\mathrm{m} * \mathrm{E} / \mathrm{g})^{\wedge} .5$ |  |
| $\begin{gathered} 1=\mathrm{ke} / \mathrm{c} /\left(\mathrm{h} /(2 \mathrm{pi})^{*} \mathrm{hc} /(2 \mathrm{pi}) /\left(\mathrm{m}^{*} \mathrm{E} / \mathrm{g}\right)^{\wedge} .5\right. \\ \mid \mathrm{r}=\mathrm{hc} /(2 \mathrm{pi}) /\left(\mathrm{m}^{*} \mathrm{E} / \mathrm{g}\right)^{\wedge} .5 \end{gathered}$ |  |
|  |  |
| 1=ke/c/(h/(2pi)*r |  |
| $\mathrm{pc}=\mathrm{ke}$ | ( $\mathrm{p}=$ momentum) |
| 1=p*r/(h/(2pi) | (pr=action) |
