ABSTRACT

Theoretical physicists claim that ether doesn't exist but that is a fallacy, the Michelson/Morley experiment proved that there was no ether wind but that doesn't mean that ether doesn't exist. There are 4 obvious clues that ether exists, frame dragging, the whirlpool properties of galaxies, time dilation and a property of light. Ether exists, Einstein was wrong.

INTRODUCTION

Frame dragging tells us that ether exists;

A spinning celestial object continuously drags along space, what happens when a spinning celestial object continuously drags along its environment? When that celestial object continuously twists its environment, then it will always create a whirlpool in that environment and a whirlpool always requires a medium (ether). There is no friction (grip) between that celestial object and space, so that celestial object can only drag space along when it continuously absorbs space and that also requires a medium (ether). That is why there was no ether wind with that Michelson/Morley experiment, the Earth is dragged along in the ether whirlpool of the Sun (same speed) and the Earth itself creates its own ether whirlpool with frame dragging.

The whirlpool properties of galaxies tell us that ether exists;

Each galaxy has several whirlpool properties, those whirlpool properties are an empty eye (black hole), jets, spiral arms, differential orbital speeds of the streams (and the objects (stars) in those streams), and a wave-like motion of those streams (stars move up and down in their orbit). When you look at a whirlpool in water, a hurricane and a spiral galaxy then you will see that they have the same structure, a whirlpool structure in water, a whirlpool structure in air and a whirlpool structure in space. A galaxy can only have several whirlpool properties if it's a whirlpool and a whirlpool always requires a medium (ether), in nature you can only find whirlpool properties in a whirlpool and that whirlpool is usually created by turbulent streams.

Time dilation tells us that ether exists;

When an object speeds up outside a gravitational field then time slows down, the reason why time slows down is a speed. There is no gravity in that situation and that means that time cannot be affected by gravity, so we can conclude that spacetime doesn't exist outside a gravitational field. And if spacetime doesn't exist outside a gravitational field, then we can conclude that spacetime also doesn't exist inside a gravitational field. So spacetime is a fallacy, you cannot claim that time is affected by gravity if you don't know what gravity and time are. The speed of that object is not the reason why time slows down, the speed itself is nothing. Time can only slow down by a tangible thing, and that tangible thing is speeding up. There is nothing else out there, just the atoms and space. So we can conclude that time slows down because the speed of space in relation to those atoms increases, so time is affected by the speed of space. Theoretical physicists don't realize that time is only affected by the speed of space, so time is only affected by the speed of space inside a gravitational field. And that tells us that space is also speeding up when you get nearer to a celestial object, and that is only possible if that celestial object continuously absorbs space. So space doesn't bend near a celestial object, space is continuously absorbed by a celestial object and that requires a medium (ether).

A property of light tells us that ether exists;

You cannot add a speed to the speed of light, that is a unique property. There is only one speed in nature with that property, that is the transfer speed of a medium. A signal in a nerve has a transfer speed and the nerve is its medium, you cannot add a speed to the speed of that signal. So light is transferred through a medium, so we can conclude that ether exists.

We can also conclude that ether exists by looking at light itself;

Light has no mass and therefore it cannot experience time, time dilation shows us that time is created by atoms (matter). Light doesn't experience time, so the speed of light cannot be the speed of light itself because a speed is a distance in a certain amount of time. And if the speed of light is not the speed of light itself, then light cannot cover a distance by itself. And if light cannot cover a distance by itself then light can only be transferred by a medium, so a photon is transferred from one ether particle to another. The speed of light is in fact the transfer speed of ether, it's the processing speed of a medium. That is why light bends around a celestial object, it follows its medium. Light follows the round shape of an ether whirlpool around a celestial object, that ether whirlpool is created by frame dragging. So it's not gravitational lensing, it's whirlpool lensing. The ether whirlpool of a galaxy is created by turbulent streams, its black hole is black because light cannot enter it. The ether in the eye of that ether whirlpool is thrown outwards in jets, those jets are invisible but they become visible when matter is mangled up.

CONCLUSION

There are 4 obvious clues that ether exists, so we can conclude that the universe is filled with ether. And if the universe is filled with ether then space doesn't bend, so Einstein's theory of gravity is wrong. But that continuous absorption of ether by a celestial object has the same mathematical model as Einstein's curvature of space, the curvature of space can also be seen as an increase in the speed of space and that results in an increase of gravity. So gravity is the side effect of that continuous absorption stream, we are dragged towards Earth because our weightless bodies have a continuous grip on the ether that is continuously absorbed by the Earth. And time slows down because it gets more difficult for the atoms to absorb ether when the speed of ether increases, so time can only be that process of the continuous absorption of ether by matter. That is why gravity and time change simultaneously, they are both simultaneously affected by the speed of ether. Theoretical physicists got lost in mathematical fiction because they believed that Einstein was right about the curvature of space (curved spacetime), but he was wrong. Einstein described reality with his theory of gravity, but he gave us a fictional reason for gravity. But Einstein was right about the mathematical model, he described the mathematical model of the continuous absorption of ether by a celestial object but without knowing it. So Einstein's gravity, spacetime, gravitational waves, massive black holes, dark matter, etc don't exist and those mistakes were devastating to theoretical physics, those fictional things are the result of fallacies. They recently claimed that they found two gravitational waves but a gravitational wave cannot exist, that is why there is no proof. You can only claim that you found a gravitational wave when you prove that space bends, when you prove that spacetime exists because a gravitational wave can only exist in spacetime, and when you prove that a black hole is massive and they don't even know what a black hole is. They said that those signals could only be the result of two merging black holes, but that doesn't prove that those signals were real. Those signals matched up with two predicted gravitational waves, they matched up because they were not real as well. The discovery of those gravitational waves seems to prove that space bends, that spacetime is real and that a black hole is massive, and that is nonsense.
