ABSTRACT

Theoretical physicists claim that ether doesn't exist, but they are wrong. Those physicists failed to see that there are 4 obvious clues that tell us that ether exists, those clues are frame dragging, the whirlpool (vortex) properties of galaxies, time dilation and a unique property of light. You can trace back that ether exists with those clues, those clues require a medium that acts like a fluid or gas. There are a lot of fallacies in theoretical physics, a lot of wrong conclusions. For example the theories about whirlpools in space (vortex theories), those theories might be incorrect but that doesn't mean that there are no whirlpools in the universe (a fallacy). And physicists made the same mistake with the Michelson/Morley experiment, no ether wind doesn't mean that ether doesn't exist (also a fallacy). There was no ether wind but they forgot to ask themselves a very important question, "why was there no ether wind?". Ether exists and that means that Einstein was wrong about his theory of gravity, space doesn't bend.

INTRODUCTION

There are 4 obvious clues that ether exists, I will show you how you can trace back that ether exists;

Frame dragging tells us that ether exists;

A spinning celestial object continuously drags along space, what happens when a spinning celestial object continuously drags along its frictionless environment? When that celestial object continuously twists its frictionless environment, then it will always create a whirlpool in that frictionless environment and a whirlpool always requires a medium that acts like a fluid or gas (ether). Physicists knew that there is no friction (grip) between that celestial object and space, they failed to see that there was only one option to continuously drag along space. That celestial object can only drag along space when it continuously absorbs space, because that continuous absorption creates a continuous grip. And because it cannot absorb a vacuum (space), you can conclude that there must be a medium that fills up space (ether). That is why there was no ether wind with that Michelson/Morley experiment, the Earth is dragged along in the ether whirlpool of the Sun (same speed) and the Earth itself creates its own ether whirlpool because it continuously drags along ether (frame dragging).

The whirlpool properties of galaxies tell us that ether exists;

Each galaxy has several whirlpool properties, those unique whirlpool properties are an empty eye (black hole), jets, spiral arms, differential orbital speeds of the streams and the objects (stars) in those streams (stars), and a wave-like motion of those streams (stars move up and down in their orbit). When you look at a whirlpool in water, a hurricane in air and a spiral galaxy in space, then you will see that they have the same structure. A whirlpool structure in water, a whirlpool structure in air and a whirlpool structure in space. A galaxy can only have several whirlpool properties if it's a whirlpool and a whirlpool always requires a medium that acts like a fluid or gas (ether), in nature you can only find whirlpool properties in a whirlpool. And that whirlpool is usually created by turbulent streams, so you can also conclude that there are turbulent ether streams in the universe.

Time dilation tells us that ether exists;

When an object speeds up outside a gravitational field then time slows down for that object and everything in that object, the reason why time slows down is a speed. There is no gravitational field in that situation and that means that we can conclude that time doesn't slow down because of gravity, because if that object would stand still outside a gravitational field then time would speed up. So we can also conclude that spacetime doesn't exist outside a gravitational field, and if spacetime doesn't exist outside a gravitational field then we can also conclude that spacetime doesn't exist inside a gravitational field. So spacetime is also a fallacy, and you cannot even claim that time is affected by gravity because you don't know what gravity and time are (also a fallacy). The speed of the object itself is not the reason why time slows down, the speed itself is nothing. The reason why time slows down must be a tangible thing, and that tangible thing is speeding up. There is nothing else out there when that object speeds up, just the atoms and space. So we can conclude that time slows down because the speed of space in relation to those atoms increases, so time is affected by the speed of space. Theoretical physicists don't realize that time is only affected by the speed of space, time is only affected by the speed of space inside and outside a gravitational field. And that tells us that space is also speeding up when you get nearer to a celestial object, and that is only possible if that celestial object continuously absorbs space. And because it cannot absorb a vacuum (space), you can conclude that there must be a medium that fills up space (ether). So space doesn't bend near a celestial object, ether is continuously absorbed by a celestial object and frame dragging creates a whirlpool in ether.

A unique property of light tells us that ether exists;

You cannot add a speed to the speed of light, that is a unique property. There is only one speed in nature with that unique property, that is the transfer speed of a medium. A signal in a nerve has a transfer speed and the nerve is its medium, you cannot add a speed to the speed of that signal. So we can conclude that light is transferred through a medium, we can conclude that ether exists. So a photon is transferred from one ether particle to another, the speed of light is in fact the transfer speed of ether (the processing speed of a medium). That is why light bends around a celestial object, it follows its medium. Light follows the round shape of an ether whirlpool around a celestial object, that ether whirlpool is created by frame dragging. So it's not gravitational lensing, it's whirlpool lensing. The ether whirlpool of a galaxy is created by turbulent streams, and its black hole is black because light cannot enter it. The ether in the eye of that ether whirlpool is continuously thrown outwards in jets, those jets are invisible but they become visible when matter is mangled up near that eye.

CONCLUSION

There are 4 obvious clues that ether exists, so we can conclude that the universe is filled with ether. Space doesn't bend, so Einstein's theory of gravity is wrong. That continuous absorption of ether by a celestial object has the same mathematical model as Einstein's curvature of space and that's why they think that Einstein was right, the curvature of space can also be seen as an increase in the speed of space and that results in an increase of gravity. So gravity is the side effect of that continuous absorption stream, we are dragged towards Earth because our weightless bodies have a continuous grip on the ether that is continuously absorbed by the Earth. And time slows down because it gets more difficult for the atoms to absorb ether when the speed of ether increases, so time can only be that process of the continuous absorption of ether by matter/atoms (I explained why in my Vixra paper 1607.0495, Time dilation, time and gravity). That is why gravity and time change simultaneously, they are both simultaneously affected by the speed of ether. Theoretical physicists got lost in mathematical fiction because they believed that Einstein was right about the curvature of space (curved spacetime), but he was wrong. Einstein described reality with his theory of gravity, but he could only give us a fictional reason for gravity because he didn't know what it was (a mathematical gravity). Einstein was right about the mathematical model, he described the mathematical model of the continuous absorption of ether by a celestial object but without knowing it. So everything that is based on or intertwined with Einstein's gravity is wrong, those things don't exist because they are based on mathematical fiction. So Einstein's gravity, spacetime, gravitational waves, massive black holes, dark matter, dark energy, etc don't exist and those mistakes were devastating to modern theoretical physics, those fictional things are the result of fallacies. They recently claimed that they found two gravitational waves but a gravitational wave cannot exist, that is why there is no proof. You can only claim that you found a gravitational wave when you prove that space bends in all directions near a celestial object, when you prove that spacetime exists because a gravitational wave can only exist in spacetime, and when you prove that a black hole is massive and physicists don't even know what a black hole is.

They said that those signals could only be the result of two merging black holes, but that doesn't prove that those signals were real (a fallacy). Those signals matched up with two predicted gravitational waves, they matched up because they were not real as well. So the discovery of those gravitational waves seems to prove that space bends, that spacetime is real and that a black hole is massive, and that is nonsense.
