Abstract

Prime numbers are the basic numbers and are crucial important. There are many conjectures concerning primes are challenging mathematicians for hundreds of years and many “advanced mathematics tools” are used to solve them, but they are still unsolved. Based on the fundamental theorem of arithmetic and Euclid’s proof of endless prime numbers, we have proved there are infinitely many twin primes.

Introduction

Prime numbers¹ are the basic numbers and are crucial important. There are many conjectures concerning primes are challenging mathematicians for hundreds of years and many “advanced mathematics tools” are used to solve them, but they are still unsolved.

I believe that prime numbers are “basic building blocks” of the natural numbers and they must follow some very simple basic rules and do not need “advanced mathematics tools” to solve them. One of the basic rules is the “fundamental theorem of arithmetic” and the “simplest tool” is Euclid’s proof of endless prime numbers.

Fundamental theorem of arithmetic:

The crucial importance of prime numbers to number theory and mathematics in general stems from the fundamental theorem of arithmetic², which states that every integer larger than 1 can be written as a product of one or more primes in a way that is unique except for the order of the prime factors.^[1] Primes can thus be considered the “basic building blocks” of the natural numbers.

Euclid's proof³ that the set of prime numbers is endless

The proof works by showing that if we assume that there is a biggest prime number, then there is a contradiction.

We can number all the primes in ascending order, so that $P_1 = 2$, $P_2 = 3$, $P_3 = 5$ and so on. If we assume that there are just n primes, then the biggest prime will be labeled P_n . Now we can form the number Q by multiplying together all these primes and adding 1, so

$$Q = (P_1 \times P_2 \times P_3 \times P_4 \dots \times P_n) + 1$$

Now we can see that if we divide Q by any of our n primes there is always a remainder of 1, so Q is not divisible by any of the primes, but we know that all positive integers are either primes or can be decomposed into a product of primes. This means that either Q must be a prime or Q must be divisible by primes that are larger than P_n.

Our assumption that P_n is the biggest prime has led us to a contradiction, so this assumption must be false, so there is no biggest prime and the set of prime numbers is endless.

Discussions

Twin Prime Conjecture: There are infinitely many twin primes.

A twin prime is a prime number that is either 2 less or 2 more than another prime number — for example, the twin prime pairs (11 and 13; 17 and 19; 41 and 43). In other words, a twin prime is a prime that has a prime gap of two.

Twin primes become increasingly rare as one examines larger ranges, in keeping with the general tendency of gaps between adjacent primes to become larger as the numbers themselves get larger. However, it is a longstanding conjecture that there are infinitely many twin primes. Work of Yitang Zhang⁴ in 2013, as well as work by James Maynard, Terence Tao and others, has made substantial progress towards proving this conjecture, but at present it remains unsolved.

Except 5, any prime must have 1, 3, 7, or 9 as its last digit. Let \$1 represents a prime with 1 as its last digit, such as 11, 31, 41, 61, 71, 101, 131, 151, 181, 191,...; \$3 represents a prime with 3 as its last digit, such as 3, 13, 23, 43, 53, 73, 83, 103, 113, 163, 193....; \$7 represents a prime with 7 as its last digit, such as 7, 17, 37, 47, 67, 97, 107, 127, 137, 157, 167, 197...; and \$9 represents a prime with 9 as its last digit, such as 19, 29, 59, 79, 89, 109, 139, 149, 179, 199,....

Let O1 represents an odd number with 1 as its last digit, such as 11, 21, 31, 41, 51, 61, 71,...; O3 represents an odd number with 3 as its last digit, such as 3, 13, 23, 33, 43, 53, 63, 73,....; O7 represents an odd number with 7 as its last digit, such as 7, 17, 27, 37, 47, 57, 67, 77...; and O9 represents an odd number with 9 as its last digit, such as 9, 19, 29, 39, 49, 59, 69, 79,....

Fundamental theorem of arithmetic states that every integer larger than 1 can be written as a product of one or more primes in a way that is unique except for the order of the prime factors.

Let N_o represent any odd number, the chance of N_o to be a non-prime is: $[(1/3) + (1/7 \times 2/3) + (1/11 \times 2/3 \times 6/7) + (1/13 \times 2/3 \times 6/7 \times 10/11) + (1/17 \times 2/3 \times 6/7 \times 10/11 \times 12/13)]$

$$\begin{aligned}
&+(1/19 \times 2/3 \times 6/7 \times 10/11 \times 12/13 \times 16/17) + (1/23 \times 2/3 \times 10/11 \times 12/13 \times 6/7 \times 16/17 \times 18/19) \\
&+(1/29 \times 2/3 \times 10/11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23) + \\
&(1/31 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29) + \\
&(1/37 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 30/31) + \\
&(1/41 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 30/31 \times 36/37) + \\

&(1/47 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 30/31 \times 36/37 \times 40/41 \times 42/43 + \dots) \text{-----} \\
&\text{---Formula 1}
\end{aligned}$$

Let \sum represent the sum of the infinitely terms. According to Euclid's proof³ that the set of prime numbers is endless, \sum may be very close to 1 when N is growing to ∞ , but always less than 1. Let $\Delta=1-\sum$, when N is growing to ∞ , Δ may be very close to 0, but always more than 0. If Δ is 0, then there is no prime.

$$\begin{aligned}
&\text{The chance of } N_o \text{ to be a prime is: } \Delta=1-[(1/3) + (1/7 \times 2/3) + (1/11 \times 2/3 \times 6/7) + \\
&(1/13 \times 2/3 \times 6/7 \times 10/11) + (1/17 \times 2/3 \times 6/7 \times 10/11 \times 12/13) + (1/19 \times 2/3 \times 6/7 \times 10/11 \times 12/13 \times 16/17) + \\
&(1/23 \times 2/3 \times 10/11 \times 12/13 \times 6/7 \times 16/17 \times 18/19) + (1/29 \times 2/3 \times 10/11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23) + \\
&(1/31 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29) + \\

&(1/43 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 30/31 \times 36/37 \times 40/41) + \\
&(1/47 \times 2/3 \times 10 \times 11 \times 12/13 \times 6/7 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 30/31 \times 36/37 \times 40/41 \times 42/43 + \dots) \text{-----} \\
&\text{---Formula 2}
\end{aligned}$$

Every odd number (O1) with 1 as its last digit is a product of \$1x\$1, \$3x\$7 or \$9x\$9; the second \$1 is decided by the first \$1 and \$7 is decided by \$3, so we need to consider only \$1, \$3, and \$9.

Every odd number (O3) with 3 as its last digit is a product of \$3x\$1 or \$7x\$9; \$1 is decided by \$3 and \$9 is decided by \$7, so we need to consider only \$3 and \$7.

Every odd number (O7) with 7 as its last digit is a product of \$7x\$1 or \$3x\$9; \$1 is decided by \$7 and \$9 is decided by \$3, so we need to consider only \$3 and \$7 (same as O3).

Every odd number (O9) with 9 as its last digit is a product of \$1 x\$9, \$3x\$3 or \$7x\$7; so we need to consider only \$1, \$3, and \$7.

If a number (N>3) is not divisible by 3 or any prime which is smaller or equal to N/3, it must be a prime. Any number is divisible by 7, it have 1/3 chance is divisible by 3, any number

is divisible by 13, it has 1/3 chance to be divisible 3 and 1/7 chance to be divisible by 7, so on, so we have terms: 1/3, 1/7x2/3, 1/13x2/3x6/7..., For number N, there are N/10 odd number with 1 as its last digit, N/10 odd number with 3 as its last digit, N/10 odd number with 7 as its last digit, and N/10 odd number with 9 as its last digit.

The chance of any odd number O1 to be a prime is: $\Delta_1=1-\sum_1=1-[(1/3) + (1/11x2/3) + (1/13x2/3x10/11)+ (1/19x2/3x10/11x12/13) + (1/23x2/3x10/11x12/13x18/19) + (1/29x2/3x10/11x12/13x18/19x22/23) + (1/31x2/3x10/11x12/13x18/19x22/23x28/29) + (1/41x2/3x10/11x12/13x18/19x22/23x28/29x30/31)] + (1/43x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41)+...]$ -----Formula 3

The sum of first 20 terms = $[(1/3) + (1/11x2/3) + (1/13x2/3x10/11) + (1/19x2/3x10/11x12/13) + (1/23x2/3x10/11x12/13x18/19) + (1/29x2/3x10/11x12/13x18/19x22/23) + (1/31x2/3x10/11x12/13x18/19x22/23x28/29) + (1/41x2/3x10/11x12/13x18/19x22/23x28/29x30/31) + (1/43x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41)+ (1/53x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43) + (1/59x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53) + (1/61x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59) + (1/71x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61) + (1/73x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71)+ (1/79x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73) + (1/83x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73x78/79) + (1/89x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73x78/79x82/83) + (1/101x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73x78/79x82/83x88/89) + (1/103x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73x78/79x82/83x88/89x100/101) + (1/109x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41x42/43x52/53x58/59x60/61x70/71x72/73x78/79x82/83x88/89x100/101x102/103)] = 0.333333 + 0.060606 + 0.046620 + 0.029444 + 0.046086 + 0.01748 + 0.01568 + 0.011966 + 0.010747 + 0.008517 + 0.007506 + 0.006484 + 0.006032 + 0.005783 + 0.00529 + 0.004953 + 0.004564 + 0.003976 + 0.003861 + 0.003612 = 0.63254$

For the first 20 term: $\sum_1=\sum_1= 0.63254$, $\Delta_1=1-\sum_1=0.36746$, for any number N, $\Delta_1 >0$

Or: $\Delta_1=1-\sum_1=1-[(1/3) + (1/7 \times 2/3) + (1/11 \times 2/3 \times 6/7)] + (1/17 \times 2/3 \times 6/7 \times 10/11) +$
 $(1/19 \times 2/3 \times 6/7 \times 10/11 \times 16/17) + (1/29 \times 2/3 \times 6/7 \times 10/11 \times 16/17 \times 18/19) +$
 $(1/31 \times 2/3 \times 6/7 \times 10/11 \times 16/17 \times 18/19 \times 28/29) + (1/41 \times 2/3 \times 6/7 \times 10/11 \times 16/17 \times 18/19 \times 28/29 \times 30/31)$
 $+ (1/47 \times 2/3 \times 6/7 \times 10/11 \times 16/17 \times 18/19 \times 28/29 \times 30/31 \times 40/41) + \dots]$ -----Formula 4

The chance of any odd number O3 (\$3 x \$1, or \$7 x \$9) to be a prime is: $\Delta_3=1-\sum_3=1-[(1/3) +$
 $(1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + (1/23 \times 2/3 \times 12/13 \times 6/7 \times 16/17) +$
 $(1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23) + (1/43 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23 \times 36/37) +$
 $(1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23 \times 36/37 \times 42/43) + \dots]$ -----Formula 5

& 0.660395
\end{aligned}$$

For the first 20 term: $\sum_9 = \sum_9 = 0.660395$, $\Delta_9 = 1 - \sum_9 = 0.339605$, for any number N, $\Delta_9 > 0$

Euclid's proof that the set of prime numbers is endless, from these formulas, primes \$1, \$3, \$7, \$9 should be endless.

$$\begin{aligned}
\text{Or: } \Delta_9 = 1 - \sum_9 = 1 - & [(1/3) + (1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + \\
& (1/19 \times 2/3 \times 6/7 \times 12/13 \times 16/17) + (1/23 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 18/19) + \\
& (1/29 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 18/19 \times 22/23) + (1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 18/19 \times 22/23 \times 28/29) \\
& + (1/43 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 36/37) + \\
& (1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 18/19 \times 22/23 \times 28/29 \times 42/43) + \dots] \text{-----Formula 9}
\end{aligned}$$

The chance for O3 following a non-prime, O1, to be a prime is: $\Delta_3 = 1 - \sum_3 = 1 - \{[(1/3) + (1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + (1/23 \times 2/3 \times 12/13 \times 6/7 \times 16/17) + (1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23) + (1/43 \times 2/3 \times 6/7 \times 16/17 \times 36/37 \times 12/13 \times 22/23) + (1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 36/37 \times 22/23 \times 42/43) + \dots]$

The chance for O3 following a prime, \$1, to be a prime is: $\Delta_3 = 1 - \sum_3 = 1 - \{[(1/3) + (1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + (1/23 \times 2/3 \times 12/13 \times 6/7 \times 16/17) + (1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23) + (1/43 \times 2/3 \times 6/7 \times 16/17 \times 36/37 \times 12/13 \times 22/23) + (1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 36/37 \times 22/23 \times 42/43) + \dots] - 1/\$1 \times 2/3 \times 6/7 \times \dots\}$

Let assume the pair, \$1_x, \$3_x is the largest twin pair, however we know both \$1_x and \$3_x are endless, there are \$1_{x+1}, \$1_{x+2}, \$1_{x+3},... \$1_{x+n}, and \$3_{x+1}, \$3_{x+2}, \$3_{x+3},... \$3_{x+n}. We need only find if there is at least 1 of \$3_{x+n} follow 1 of \$1_{x+n}. any \$1 can be divisible by only 1 and itself, so \$1_{x+n} plus 2 (also true for plus 4 and 6) cannot be divisible by \$1_{x+n} because the smallest \$1_{x+n} is 11.

The chance for O3 following a non-prime, O1, to be a prime is: $\Delta_3 = 1 - \sum_3 = 1 - \{[(1/3) + (1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + (1/23 \times 2/3 \times 12/13 \times 6/7 \times 16/17) + (1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23) + (1/43 \times 2/3 \times 6/7 \times 16/17 \times 36/37 \times 12/13 \times 22/23) + (1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 36/37 \times 22/23 \times 42/43) + \dots]$

The chance for O3 following a prime, \$1, to be a prime is: $\Delta_3 = 1 - \sum_3 = 1 - \{[(1/3) + (1/7 \times 2/3) + (1/13 \times 2/3 \times 6/7) + (1/17 \times 2/3 \times 6/7 \times 12/13) + (1/23 \times 2/3 \times 12/13 \times 6/7 \times 16/17) +$

$$(1/37 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 22/23) + (1/43 \times 2/3 \times 6/7 \times 16/17 \times 36/37 \times 12/13 \times 22/23) + (1/47 \times 2/3 \times 6/7 \times 12/13 \times 16/17 \times 36/37 \times 22/23 \times 42/43) + \dots - 1/\$1_{x+1}$$

The O3 next to $\$1_{x+1}$ is only 2 (also is true for 4 and 6 difference) different from $\$1_{x+1}$. So the term is a single term $1/\$1_{x+1}$. For limited n primes, $\$1_{x+n}$, we will have $-[1/\$1_{x+1} + 1/\$1_{x+2} + 1/\$1_{x+3}, \dots + 1/\$1_{x+n}]$. If the number n of primes $\$1 \geq \1_{x+1} , then: $n(1/1_{x+1} + 1/\$1_{x+2} + 1/\$1_{x+3}, \dots + 1/\$1_{x+n}) = (\$1_{x+1}/\$1_{x+1} + \$1_{x+1}/\$1_{x+2} + \$1_{x+1}/\$1_{x+3}, \dots, \$1_{x+1}/\$1_{x+n}) = (1 + \$1_{x+1}/\$1_{x+2} + \$1_{x+1}/\$1_{x+3}, \dots, \$1_{x+1}/\$1_{x+n}) > 1$, so $n\Delta_3 = n - n\sum_3 + (1 + \$1_{x+1}/\$1_{x+2} + \$1_{x+1}/\$1_{x+3}, \dots, \$1_{x+1}/\$1_{x+n})$, even if $\sum_3 = 1$, $n\Delta_3 > 1$, so there is at least 1 more $\$3_{x+n}$ following one of $\$1_{x+n}$ for every n primes of $\$1_{x+n}$, $\$1$ is endless, then twin prime pairs ($\$1, \3) is endless. It is easy to prove ($\$7, \9), ($\$9, \1), ($\$3, \$7, p+4$ prime), ($\$7, \$1, p+4$ prime), ($\$1, \$7, \text{sexy prime}$), ($\$7, \3), and ($\$3, \9) are endless.
