

The Internationalist Model of The Second Task

[Author: Miguel A. Sanchez-Rey]

The internationalist model can be seen as the most likely resolution to The Second Task. The Second Task which has been established as a resolution to an extraterrestrial conflict. In which the aim is to achieve co-existence with other intelligent life-forms outside the solar system and to begin the process of laying out habitable zones outside the solar system. Habitable zones that are scattered very much like island chains in the Pacific Ocean on planet Earth. Which will allow, with space-habitats, for human settlement and technological industrial development. Furthering the extraction of minerals and energy resources needed to sustain human life.

But in which one dares not interfere in the livelihood of other intelligent creatures in the outer-habitable zones that if done will lead to a catastrophic conflict in which no way out is presentable to Earth's solar system and outer regions. That said the internationalist model appears as the most likely resolution.

The other avenue amongst exobiologists and astronomers is either the development or acquiring of a star-map that will guide humanity through the solar system and throughout the Milky Way. But to even consider such an avenue requires the surveying of the Milky Way which will take, with feasible technological means, nearly 2 million years to complete and to acquire such a map

will lead to genocide and/or a large-scale conflict. For a star map means the capacity to know everything there is to know about the outer habitable zones. For those reasons the star map is a dead enterprise and the internationalist model is the likely option in which resolution of The Second Task will lead to peaceful First Contact and eventually coexistence.
