ABSTRACT

The conclusion of the Michelson Morley experiment is one of the biggest mistakes in theoretical physics, the absence of an ether wind doesn't prove that ether doesn't exist.

INTRODUCTION

Michelson and Morley tried to detect a difference in the speed of light in their experiment, that difference would prove that there was an ether wind. They compared the speed of light in perpendicular directions, but they found no difference. So physicists concluded that the result was strong evidence against the ether theory, but that was a huge mistake. The absence of an ether wind doesn't prove that ether doesn't exist, it only proves that the ether wind theory was incorrect.

Physicists failed to see that the ether wind theory could be incorrect, an ether wind theory is based on the assumption that planets rush through stationary ether or that planets spin through stationary ether but that ether theory could be incorrect. If the planets don't rush/spin through stationary ether, then there would not be an ether wind. Physicists came to the wrong conclusion, they used an incorrect theory and that mistake was devastating to theoretical physics. They concluded that light travels through a vacuum, but that conclusion was incorrect.

Physicists failed to see that light has the speed properties of a transfer speed of a medium, that clue tells us that photons are transferred from one ether particle to another with a transfer speed of 300.000 km/s (I explain why in my Vixra paper 1706.0367). That is why you cannot add a speed to the speed of light, the medium (ether) states the speed of the photons. So you cannot even detect an ether wind with light, the photons would not be affected by an ether wind. The photons would be transferred between the ether particles inside the structure of that ether wind, so it would be impossible to detect an ether wind with light.

And physicists also failed to see that there were 3 other clues that ether exists, those clues are time dilation, the whirlpool properties of galaxies and frame dragging. Whirlpool properties can only be found in a whirlpool and a whirlpool requires a medium that is made of loose particles, and in space it can only be ether. And frame dragging also proves that ether exists, continuously dragging along the environment always results in a whirlpool in that environment.

That is why our planets have differential orbital speeds (whirlpool property), they are dragged along in the ether whirlpool of the Sun and that ether whirlpool was created by frame dragging. So Michelson and Morley could already have known that there was no ether wind because those differential orbital speeds tell us that the ether is not stationary, objects in a whirlpool are dragged along by whirlpool streams.

I explained how those clues prove that ether exists in my Vixra paper 1508.0191, that paper also describes the origin of gravity and time and their origin reveals itself. Time is a process whereby atoms continuously absorb and use ether, and gravity is the side effect of time. Gravity works like this, the atoms of our weightless body continuously absorb and use ether and that results in a continuous grip on the surrounding ether, so we are continuously dragged/drawn towards Earth because we have a continuous grip on the ether that is continuously absorbed and used by the Earth.

CONCLUSION

The result of the Michelson Morley experiment was a huge mistake, it didn't prove that ether doesn't exist.
