

Refutation of Lyndon interpolation

© Copyright 2018 by Colin James III All rights reserved.

Abstract: We evaluate the Lyndon interpolation on the logic **GL**. Each is *not* tautologous, and the combination is *not* tautologous, hence rendering both refuted.

We assume the method and apparatus of Meth8/VL4 with Tautology as the designated *proof* value, **F** as contradiction, **N** as truthity (non-contingency), and **C** as falsity (contingency). The 16-valued truth table is row-major and horizontal. The 16-valued truth table is row-major and horizontal, or repeating fragments of 128-tables, sometimes with table counts, for more variables. (See ersatz-systems.com.)

LET $p, q, r, s: \phi$ phi, ψ psi, v , theta θ .

Definition 2.2. The least normal logic is called **K**.

$$\mathbf{K} = \square(p \rightarrow q) \rightarrow (\square p \rightarrow \square q) \quad (2.2.0.1)$$

$$\#(p > q) > (\#p > \#q); \quad \text{TTTT TTTT TTTT TTTT} \quad (2.2.0.2)$$

$$\mathbf{GL} = \mathbf{K} + \{\square(\square p \rightarrow p) \rightarrow \square p\} \quad (2.2.1.1)$$

$$\begin{aligned} & (\#(p > q) > (\#p > \#q)) \& (\#(\#p > p) > \#p); \\ & \text{CTCT CTCT CTCT CTCT} \quad (2.2.1.2) \end{aligned}$$

Eq. 2.2.1.2 as **GL** is *not* tautologous. This means logic **GL** is *not* a logic proved as a theorem.

Definition 2.5. We say a logic **L** enjoys the Lyndon interpolation property (LIP) if for any formulas ϕ and ψ , if $L \vdash$

$$\phi \rightarrow \psi, \quad (2.5.0.1)$$

$$p > q; \quad \text{TF TT TF TT TF TT TF TT} \quad (2.5.0.2)$$

then there exists a formula θ satisfying the following properties:

$$1. v+(\theta) \subseteq v+(\phi) \cap v+(\psi); \quad (2.5.1.1)$$

$$\sim(((r \& p) \& (r \& q)) < (r \& s)) = (p=p); \quad \text{TTTT TTTTF TTTT TTTT} \quad (2.5.1.2)$$

$$2. v-(\theta) \subseteq v-(\phi) \cap v-(\psi); \quad (2.5.2.1)$$

$$\sim(((\sim r \& p) \& (\sim r \& q)) < (\sim r \& s)) = (p = p); \quad \begin{matrix} \text{TTTT} & \text{TTTT} & \text{TTTT} & \text{TTTT} \end{matrix} \quad (2.5.2.2)$$

$$3. L \vdash \phi \rightarrow \theta; \quad (2.5.3.1)$$

$$p > s; \quad \begin{matrix} \text{FTFT} & \text{FTFT} & \text{TTTT} & \text{TTTT} \end{matrix} \quad (2.5.3.2)$$

$$4. L \vdash \theta \rightarrow \psi. \quad (2.5.4.1)$$

$$s > q; \quad \begin{matrix} \text{TTTT} & \text{TTTT} & \text{FFTT} & \text{FFTT} \end{matrix} \quad (2.5.4.2)$$

Such a formula θ is said to be a Lyndon interpolant of $\phi \rightarrow \psi$ in L .

The argument becomes: $\phi \rightarrow \psi$ implies that if $(v+(\theta) \subseteq v+(\phi) \cap v+(\psi))$ and $(v-(\theta) \subseteq v-(\phi) \cap v-(\psi))$ and $\phi \rightarrow \theta$ and $\theta \rightarrow \psi$, then θ as Lyndon interpolant. (2.5.5.1)

$$\begin{aligned} & (p > q) > (((\sim(((\sim r \& p) \& (\sim r \& q)) < (\sim r \& s))) \\ & \& \sim(((r \& p) \& (r \& q)) < (r \& s))) \& ((p > s) \& (s > q))) > s); \end{aligned} \quad \begin{matrix} \text{FTFT} & \text{FTFT} & \text{TTTT} & \text{TTTT} \end{matrix} \quad (2.5.5.2)$$

Eq. 2.5.5.2 as rendered is *not* tautologous. This means the Lyndon interpolation is refuted.

Remark 5: To assert that the non-tautologous Lyndon interpolation applies to the non-tautologous logic **GL** is a further mistake. (5.0.1.1)

$$\begin{aligned} & ((p > q) > (((\sim(((\sim r \& p) \& (\sim r \& q)) < (\sim r \& s))) \& \\ & \sim(((r \& p) \& (r \& q)) < (r \& s))) \& ((p > s) \& (s > q))) > s) \& \\ & ((\#(p > q) > (\#p > \#q)) \& (\#(\#p > p) > \#p)); \end{aligned} \quad \begin{matrix} \text{FTFT} & \text{FTFT} & \text{CTCT} & \text{CTCT} \end{matrix} \quad (5.0.1.2)$$
