Manuscript received 5 August 1997, revised 28 April 1998, accepted 15 September 1998

Kinetics of oxidation of iodide ion by  $V^V$  under uncatalysed and  $Ru^{III}$  catalysed conditions in aqueous perchloric acid medium have been studied. The reaction is first order in  $[V^V]$  and first order in  $[I^T]$ . With  $[H^+]$ , the reaction shows a complex behavior of 1.5 order till  $[H^+]$  is 0.5 M and second order beyond that concentration. In the case of  $Ru^{III}$  catalyzed oxidation, the reaction exhibits a dual character of first order and zero order in  $[V^V]$ . The first order component shows 1.5 order in  $[I^T]$  first order in  $[Ru^{III}]$  and 1.5 order in  $[H^+]$ . The zero order component shows first order in  $[I^T]$ , first order in  $[Ru^{III}]$  and independent of  $[H^+]$ . No catalysis has been observed with Os  $[H^+]$ . Suitable rate laws have been postulated based on the observations.

Kinetics of oxidation of iodide ion by vanadium(v) have been studied by various workers<sup>1</sup>. Different rate laws with different mechanisms have been postulated. Secco and coworkers attempted to rationalize all previous reports and suggested that the following equation

$$V = \{k_{1,5}[\Gamma][H^+] + k_{2,5}[\Gamma][H^+]^2 + k_{4,5}[\Gamma]^2[H^+]^2\}[H_4VO_4^+]$$

is able to explain all the data of their work and other investigators. But the effects of foreign ions on this reactions have not been studied earlier. So the present communication attempts to throw light on the effect of Ru<sup>III</sup> in the oxidation of I<sup>-</sup> by V<sup>V</sup>.

### Results and Discussion

## Catalyzed reactions:

The rate data did not yield constant first order rate constants and the rate constants increased during the course of the reaction. Hence an attempt was made to find out whether the data fitted into zero order rate equation. Zero order rate constant decreased with the increase in percent of reaction. It appeared that this catalyzed reaction might be composed of pseudo-first order and pseudo-zero order rate components. The experimental rates were fitted in the integrated rate equation for the possible resolution of pseudo-first order rate constants and pseudo-zero order rate constants.

$$-\frac{d[V^{V}]}{dt} = k_{1}[V^{V}] + k_{0}$$

In other words,

$$\frac{\mathsf{V}_{\mathsf{t}_{\mathsf{h}}}^{\mathsf{V}} - \mathsf{V}_{\mathsf{t}_{\mathsf{n}+1}}^{\mathsf{V}}}{t_{\mathsf{n}+1} - t_{\mathsf{n}}} = \frac{\mathsf{V}_{\mathsf{t}_{\mathsf{h}}}^{\mathsf{V}} + \mathsf{V}_{\mathsf{t}_{\mathsf{n}+1}}^{\mathsf{V}}}{2} \, k_1 + k_0$$

where  $V_{t_n}^V$  and  $V_{t_{n+1}}^V$  are the measured concentrations of the disappearing  $V^V$  at time  $t_n$  and  $t_{n+1}$  respectively,  $k_1$  and  $k_0$  are the pseudo-first order and pseudo-zero order rate constants for the reactions. The plot showed that there is definite intercept indicating the presence of pseudo-zero

order and the slope represents pseudo-first order rate constant. The kinetic data thus separated into pseudo-first order and pseudo-zero order rate constants (Table 1).

The following facts emerge from the rate data. (i) The reactions are mixed order in oxidant: first order in [VV] and zero order in [VV]. (ii) The first order component shows the following kinetic features: it is affected by increase in [H+] and the reaction has dependence of 1.5 on [H+]. The order with respect to [Ru<sup>III</sup>] is one and that with respect to [I-] is 1.5. (iii) The zero order component shows the following kinetic features: it is independent of [H+], it shows first order dependence on [Ru<sup>III</sup>] and its dependence on [I-] is nearly unity. (iv) Vanadium(v) species undergoes a series of reactions under acid conditions giving rise to its hydrolytic species<sup>2</sup>,viz. [V(OH)<sub>3</sub>]<sup>2+</sup>, [V(OH)<sub>2</sub>]<sup>3+</sup> and [VO<sup>2</sup><sub>2</sub>].

Based on these findings the rate law takes the form,

$$H_4VO_4^{+} + H^{+} \xrightarrow{K_1} V(OH)_3^{2+} + H_2O$$
 $V(OH)_3^{2+} + H^{+} \xrightarrow{K_1'} V(OH)_3^{3+} + H_2O$ 
 $Ru^{3+} + I^{-} \xrightarrow{K_2} C_1$ 
 $Ru^{3+} + 2I^{-} \xrightarrow{K_2} C_1$ 
 $C_1 + V(OH)_2^{2+} \xrightarrow{K'_3} C_2 \xrightarrow{k_1} Products$ 

$$C_1 + V(OH)^{2+} \xrightarrow{K'_3} C_2 \xrightarrow{k_2}$$
 Products
 $C_1 + V(OH)^{3+} \xrightarrow{K'_3} C_3 \xrightarrow{k_2}$  Products

$$C'_1 + V(OH)_3^{2+} \xrightarrow{K_4} C_4 \xrightarrow{k_3} Products$$

$$C'_1 + V(OH)_3^{2+} \stackrel{K'_4}{\longleftarrow} C_5 \stackrel{k'_4}{\longrightarrow} Products$$

Rate = 
$$k_1C_2 + k_2C_3 + k_3C_4 + k_4C_5$$
  
=  $k_1K_3C_1[V(OH)_3^2^+] + k_2K_3'C_1[V(OH)_2^2^+] +$ 

 $k_3K_4C_1'[V(OH)_3^{2+}] + k_4K_4'C_1'[V(OH)_2^{3+}]$   $= k_1K_3C_1[V(OH)_3^{2+}] + k_2K_3'C_1K_1'[V(OH)_3^{2+}][H^+] + k_3K_4C_1'[V(OH)_3^{2+}] + k_4K_4'C_1'K_1'[V(OH)_3^{2+}][H^+]$ 

$$\begin{bmatrix} V_{T}^{\mathsf{Y}} \end{bmatrix} = \frac{[\mathsf{V}(\mathsf{OH})_{3}^{2}^{+}]}{K_{1}[\mathsf{H}^{+}]} \{ 1 + K_{1}\mathsf{H}^{+} + K_{1}k_{1}[\mathsf{H}^{+}]^{2} + K_{1}K_{2}K_{3}[\mathsf{Ru}^{\mathsf{III}}][\Gamma][\mathsf{H}^{+}] + K_{1}K_{2}K_{3}'[\mathsf{Ru}^{\mathsf{III}}][\Gamma][\mathsf{H}^{+}]^{2} + K_{1}K_{2}'K_{4}[\mathsf{Ru}^{\mathsf{III}}][\Gamma]^{2}[\mathsf{H}^{+}] + K_{1}K_{1}'K_{2}'K_{4}'[\mathsf{Ru}^{\mathsf{III}}][\Gamma]^{2}[\mathsf{H}^{+}]^{2} \}$$

Rate = 
$$[V(OH)_3^{2+}]\{k_1K_3C_1 + k_2K_1'K_3'C_1[H^+] + k_3K_4C_1' + k_4K_4'C_1'K_1'[H^+]\}$$

=  $[V(OH)_3^2^+](k_1K_2K_3[Ru^{III}][\Gamma] + k_2K_1'K_2K_3'[Ru^{III}][\Gamma][H^+] + k_3K_4K_2'[Ru^{III}][\Gamma]^2 + k_4K_4'K_1'K_2'[Ru^{III}][\Gamma]^2[H^+])$ 

 $[V_{1}^{Y}][Ru^{III}](k_{1}K_{1}K_{2}K_{3}[H^{+}][\Gamma] + k_{2}K_{1}K_{1}'K_{2}K_{3}']$ Rate =  $\frac{[\Gamma][H^{+}]^{2} + k_{3}K_{1}K_{2}K_{4}[H^{+}][\Gamma]^{2} + k_{4}K_{1}K_{1}'K_{2}'K_{4}'[\Gamma]^{2}[H^{+}]^{2}}{1 + K_{1}[H^{+}] + K_{1}K_{1}'[H^{+}]^{2} + K_{1}K_{2}K_{3}[H^{+}][Ru^{III}][\Gamma]} + K_{1}K_{2}K_{3}'[Ru^{III}][\Gamma][H^{+}]^{2} + K_{1}K_{2}'K_{4}[Ru^{III}][\Gamma]^{2}[H^{+}] + K_{1}K_{1}'K_{2}'K_{4}'[Ru^{III}][\Gamma]^{2}[H^{+}]^{2}$ 

The observed first order in  $[V^V]$ , 1.5 order in  $[I^-]$ , first order in  $[Ru^{III}]$  and 1.5 order in  $[H^+]$  can be rationalized by the above rate law.

The corresponding rate law for zero order component derived as

$$Ru^{3+} + I \xrightarrow{K} C_1$$

$$C_1 \xrightarrow{k} Products$$

Rate = 
$$K k [Ru^{III}] [I^-]$$

This explains first order on [Ru<sup>III</sup>], first order on [I<sup>-</sup>] and independent of [H<sup>+</sup>] and [V<sup>V</sup>].

Effect of  $Os^{VIII}$ : The reaction is uneffected by the addition of  $Os^{VIII}$ . The rate constants in the absence and presence of  $Os^{VIII}$  concentration are presented in Table 2. Thus it is seen that these reactions are different from oxidation of I- with  $Ce^{IV}$  where catalysis is observed with both  $Ru^{III}$  and  $Os^{VIII3}$ . Similarly,  $Mn^{II}$  has no catalyzing effect in these reactions unlike as in iodide-cerium(IV) reaction rate constants are  $5.25 \times 10^{-5}$ ,  $5.25 \times 10^{-5}$  and  $6.60 \times 10^{-5}$  s<sup>-1</sup> at zero,  $0.0002067 \ M$  and  $0.005 \ M$  concentrations of  $Mn^{II}$  respectively.

	Table 2
$[V^{V}] = 5.0 \times 10^{-3} M$ , [KI] =	$3.5 \times 10^{-2} M$ , [NaClO <sub>4</sub> ] = 0.4 M, [HClO <sub>4</sub> ] =

#### Uncatalyzed reactions:

For the purpose of comparison, the uncatalysed reaction of  $I^-$  with  $V^V$  under similar experimental conditions habeen studied and it has been observed that the reactions are first order in  $[V^V]$  but the reaction rate decreases with in crease of concentration of  $V^V$  suggesting the presence of complex retarding influence. The decreasing k attained limiting value at high concentration of  $V^V$ . The results are presented in Table 4.

Reaction is first order in [I-] and [H+] showing an orde of 1.5 between 0.05 and 0.5 M [H+] and beyond 0.5 M th dependence on [H+] is 2. The sequence of reaction is as follows:

Table 4. Oxidation of iodide by vanadium(v) in aqueous perchloric acid medium uncatalyzed reactions  $(V^{V}) = 5.0 \times 10^{-3} M, (II^{-}) = 3.5 \times 10^{-2} M, (IH^{+}) = 1.0 \times 10^{-1} M, [NaClO4]$ 

Concn. of	Concn. of	$k_1 \times 10^5$

	$2.5 \times 10^{-2}$	6.132
(Sid / for Drawy)	$3.5 \times 10^{-2}$	9.848
	$6.5 \times 10^{-2}$	22.028
	$1.0 \times 10^{-1}$	32,729

$$H_4VO_4^+ + H^+ \xrightarrow{K_1} V(OH)_3^{2+} + H_2O$$
 $V(OH)_3^{2+} + H^+ \xrightarrow{K_2} V(OH)_2^{3+} + H_2O$ 
 $\Gamma + V(OH)_3^{2+} \xrightarrow{K_3} C_1 \text{ (complex)} \longrightarrow \text{Products}$ 
 $\Gamma + V(OH)_2^{2+} \xrightarrow{K_4} C_2 \text{ (complex)} \xrightarrow{k_1'} \text{Products}$ 
The breakdown of  $C_1$  and  $C_2$  can be visualized as

 $C_1 \longrightarrow V(OH)_2^+ + HIO$ 

 $C_2 \longrightarrow V(OH)^{2+} + HIO$ The products V<sup>3+</sup> and HIO are immediately converted by

$$V^{3+} + V^{5+} \longrightarrow 2 V^{4+}$$
  
HIO +  $\Gamma$  + H<sup>+</sup>  $\longrightarrow$  I<sub>2</sub> + H<sub>2</sub>O

fast reactions to V4+ and I2 as

$$V_{T}^{V}] = \frac{[V(OH)_{3}^{2+}]}{K_{1}[H^{+}]} \{ 1 + K_{1}[H^{+}] + K_{1}K_{2}[H^{+}]^{2} + K_{1}K_{3}[H^{+}][\Gamma] + K_{1}K_{2}K_{4}[H^{+}]^{2}[\Gamma] \}$$

Thus,  $C_1 = K_3 [I^-][V(OH)_3^{2+}]$ 

$$= \frac{K_1 K_3 (V_1^{\vee}) [H^+][\Gamma]}{1 + K_1 [H^+] + K_1 K_2 [H^+]^2 + K_1 K_3 [H^+][\Gamma] + K_1 K_2 K_4 [H^+]^2 [\Gamma]}$$

$$C_2 = K_4 [\Gamma] [V(OH)_2^{3+}]$$

 $= \frac{K_1 K_2 K_4 [V_T^V] [\Gamma] [H^+]^2}{1 + K_1 [H^+] + K_1 K_2 [H^+]^2 + K_1 K_3 [H^+] [\Gamma] + K_1 K_2 K_4 [H^+]^2 [\Gamma]}$ Rate =  $k_1 C_1 + k_1' C_2$ 

$$=\frac{k_1K_2K_3[\bigvee_1^{\vee}][H^{+}][\Gamma]+k_1'K_1K_2K_4[\bigvee_1^{\vee}][H^{+}]^2[\Gamma]}{1+K_1[H^{+}]+K_1K_2[H^{+}]^2+K_1K_3[H^{+}][\Gamma]+K_1K_2K_4[H^{+}]^2[\Gamma]}$$

It is necessary to comment upon the interaction of 2 I-with Ru<sup>III</sup> to form a complex C<sub>1</sub>' in the catalyzed reaction under consideration. Prima facie it may suggest a termolecular reaction. What is really envisaged in this process is that the reaction of I-with Ru<sup>III</sup> occurs stepwise to form a complex. Similar explanation based on stepwise interaction of I-with the oxidant has been advanced earlier in the study of kinetics of oxidation of arsenious acid with iodate and chromate ions<sup>4</sup>. It is not possible to discriminate whether the I- attacks the central vanadium atom or the oxygen centre. By analogy with vanadium oxychloride it is reasonable to postulate that the polarized nucleophile I-does react at the vanadium(v) centre<sup>5</sup>.

Effect of solvent: The rate constants  $(k_1 \times 10^5 \text{ s}^{-1})$  at 10, 15 and 30% aqueous acetic acid are found to be 12.15, 17.916 and 65.59 respectively. Thus establishing that it is a positive ion and negative ion reaction. The reactive species of vanadium may be either  $V(OH)_3^{2+}$  or  $V(OH)_2^{3+}$ . Similar effect of solvent acetic acid has been noted in the oxidation of I<sup>-</sup> by cerium(IV)<sup>3</sup>.

Effect of DMSO: Addition of DMSO does not result in increase in kinetic rate. This is at variance to what has been observed in DMSO in the reaction of  $I^-$  and  $Ce^{IV3}$ .

The rate constants  $(k_1 \times 10^5 \text{ s}^{-1})$  at 30, 40 and 50° are found to be 5.25, 13.587 and 36.905 respectively. Arrhenius parameters presented in Table 5 for uncatlysed reactions are of the right order of magnitude for bimolecular reaction. It is interesting to point out that the activation energy for uncatalysed reaction is much higher than that observed for catalyzed reaction. This is quite in order as the catalyzed reactions are much faster due to decrease in activation energy.

## Experimental

Potassium iodide, ammonium metavanadate, perchloric acid, sodium perchlorate and other reagents used were of analytical reagent grade. The reaction kinetics were followed by the following procedure. To the reagent solution (50 ml), the oxidant solution (50 ml) was added (the instant of half delivery being noted as zero time) and shaken well. The progress of the reaction was followed by withdrawing 5 ml aliquots at various time intervals, discharging into a

J. Indian Chem. Soc., Vol. 76, February 1999

flask containing ice-cold water. The liberated iodine was analyzed using standard sodium thiosulphate solution. In all the expériments excess of sodium perchlorate was used.

The rate constants were calculated from the slopes of  $\log(a-x)$  vs time curves using regression analysis form the experimental values in uncatalysed reactions. Linearity was observed in most of the cases up to 80% of vanadium(v) consumption, while in the case of Ru<sup>III</sup> catalyzed reactions the reaction rates did not fit in the pure first order or zero order rate. The data were fitted into the rate equation,

$$-\frac{d[V^{V}]}{dt} = k_1(a - x/2) + k_0$$

The plot of dx/dt vs (a-x/2) was drawn; intercept gave the zero order rate constant and the slope gave the first order rate constant. Results were the same even for plots of dx/dt vs (a-x).
