#### Abstract

In this paper, we propose the axiomatic regularity of prime numbers.

MSC: 11A41

Keywords: prime numbers, distribution of primes, Riemann zeta-function, structure of primes

#### 1 Introduction

In 1859, Riemann [Rie59] showed a deep connection between non-trivial zeros of the Riemann zeta-function and the prime numbers. Our motivation is to axiomatize the structure of primes.

### 2 Results

These below are some patterns of number.

Let  $t_n$  denote the *n*th triangular number. Then

$$t_n = \binom{n+1}{2} \qquad n \ge 1,$$

where  $\binom{n}{k}$  is the binomial coefficients.

Let  $F_n$  be the *n*th Fibonacci number. Then

$$F_n = \frac{(1+\sqrt{5})^n - (1-\sqrt{5})^n}{2^n \sqrt{5}},$$

where n is a positive integer.

Let  $B_n$  be the *n*th Bernoulli number. Then

$$B_n = (-1)^{n+1} n \zeta (1-n),$$

where  $\zeta(1-n)$  is the Riemann zeta-function.

If p(n) denotes the total number of partitions of n, then

$$p(n) \sim \frac{e^{\pi\sqrt{2n/3}}}{4n\sqrt{3}},$$

where n is a positive integer.

**Postulate 2.1** (Peano Postulates). Given the number 0, the set  $\mathbf{N}$ , and the function  $\sigma$ . Then:

- 1.  $0 \in \mathbf{N}$ .
- 2.  $\sigma: \mathbf{N} \to \mathbf{N}$  is a function from  $\mathbf{N}$  to  $\mathbf{N}$ .
- 3.  $0 \notin \text{range}(\sigma)$ .
- 4. The function  $\sigma$  is one-to-one.
- 5. If  $I \subset \mathbf{N}$  such that  $0 \in I$  and  $\sigma(n) \in I$  whenever  $n \in I$ , then  $I = \mathbf{N}$ .

We define  $1 = \sigma(0)$ ,  $2 = \sigma(1)$ ,  $3 = \sigma(2)$ , etc. Next, we propose the fundamental properties of prime numbers.

**Definition 2.2.** Given a positive integer n, let  $\chi(n)$  denote the number of third positive divisor of n and  $\Delta(n)$  denote the number of positive divisors of n besides 1 and n.

Indeed, 
$$\chi(1) = 0$$
 and  $\Delta(1) = 0$ .

**Postulate 2.3.** Given a prime number p,  $\sigma(n)$  denotes the sum of positive divisors of n. Then:

- 1.  $2 \le p$ .
- 2.  $4 \nmid p$ .
- 3.  $(-1)^{\chi(p)} = 1$ .
- 4.  $3 \le \sigma(p)$ .
- 5.  $\Delta(p) = 0$ .

By our observation, we get the estimation. Let  $p_n$  be the nth prime, where n is a positive integer. Then

$$p_n \sim (1 + \sin 19 \operatorname{rad}) n \log n.$$
