Abstract

Prime Quintuplet and Twin Primes have exactly the same dynamics.

All Prime Quintuplet are executed in hexagonal circulation. It does not change in a huge number (forever huge number).
In the hexagon, Prime Quintuplet are generated only at (6n -1)(6n+5). [n is a positive integer]

When the number grows to the limit, the denominator of the expression becomes very large, and primes occur very rarely, but since Prime Quintuplet are 96/3 times of the 5th power distribution of primes, the frequency of occurrence of Prime Quintuplet is very equal to 0.

However, it is not 0. Therefore, Prime Quintuplet continue to be generated.

If Prime Quintuplet is finite, the Primes is finite.
The probability of Prime Quintuplet 96/3 times of the 5th power probability of appearance of the Prime. This is contradictory. Because there are an infinite of Primes.

That is, Prime Quintuplet exist forever.

Introduction

Prime Quintuplet is represented as (6n -1) or (6n+1). And, n is positive integer.

All Prime Quintuplet are combination of (6n -1) and (6n+1).
That is, all Prime Quintuplet are a combination of 5th-angle and 1th-angle.

[*]47-8 kuyamadai, Isahaya-shi, Nagasaki-prefecture, 854-0067 Japan

5th-angle is (6n -1).
1th-angle is (6n+1).

(6n -2), (6n), (6n+2) are even numbers.

(6n -1), (6n+1), (6n+3) are odd numbers.

The Prime Quintuplet are (6n -1) and (6n+1).
There are no prime numbers that are not (6n -1) or (6n+1).
The following is a Prime Quintuplet.
5 ——— 6n -1
7 ——— 6n+1
11 ——— 6n -1
13 ——— 6n+1
17 ——— 6n -1
....
....

The Prime Quintuplet are bellow.

(5, 7, 11, 13, 17), (7, 11, 13, 17, 19), (11, 13, 17, 19, 23), (97, 101, 103, 107, 109),
(101, 103, 107, 109, 113), (1481, 1483, 1487, 1489, 1493), (1867, 1871, 1873, 1877, 1879),
(3457, 3461, 3463, 3467, 3469), (5647, 5651, 5653, 5657, 5659),
(15727, 15731, 15733, 15737, 15739), (16057, 16061, 16063, 16067, 16069),
(16061, 16063, 16067, 16069, 16073), (19417, 19421, 19423, 19427, 19429),
(19421, 19423, 19427, 19429, 19433), (21011, 21013, 21017, 21019, 21023),
(22271, 22273, 22277, 22279, 22283), (43777, 43781, 43783, 43787, 43789),
(43781, 43783, 43787, 43789, 43793),...... ....sum is 18.
......etc.......

$\frac{4^2 \times 6}{3} = \frac{96}{3}$

There are 1229 Primes frpm 1 to 1×10^4=10000.
Probability is $\frac{1229}{10000}$.
In this, there are 9 Prime Quintuplet. Probability is $\frac{9}{10000}$=0.0009
and $[\frac{1229}{10000}]^5 \times \frac{96}{3}$=0.00089724158265508768

There are 3904 Primes from 1×10^4 to 5×10^4
Probability is $\frac{3904}{40000}$.

In this, there are 9 Prime Quintuplet. Probability is $\frac{9}{40000}$=0.000225
and $[\frac{3904}{40000}]^5 \times \frac{96}{3} = 0.00028339949149356032$

and There are 5133 Primes from 1 to 5×10^4
Probability is $\frac{5133}{50000}$.
In this, there are 18 Prime Quintuplet. Probability is $\frac{18}{50000}$=0.00036
and
$[\frac{5133}{50000}]^5 \times \frac{96}{3} = 0.00036488522479450325944 32$

Discussion

Although not found in the literature, Prime Quintuplet and twin primes have exactly the same dynamics.
This means that if twin primes are infinite, Prime Quintuplet are infinite.

The probability that Prime Quintuplet will occur 96/3 times of the 5th power of the probability that a Prime will occur in a huge number, where the probability that a prime will occur is low from the equation (1).
While a Primes is generated, Prime Quintuplet be generated.

And, as can be seen from the equation below, even if the number becomes large, the degree of occurrence of Primes only decreases little by little.

$$\pi(x) \sim \frac{x}{\log x} \quad (x \to \infty) \tag{1}$$

$\log(10^{20}) = 20\log(10) \approx 46.0517018$
$\log(10^{200}) = 200\log(10) \approx 460.517018$
$\log(10^{2000}) = 2000\log(10) \approx 4605.17018$
$\log(10^{20000}) = 20000\ \log(10) \approx 46051.7018$
$\log(10^{200000})$=200000 $\log(10) \approx 460517.018$
$\log(10^{2000000})$=2000000 $\log(10) \approx 4605170.18$
$\log(10^{20000000})$=20000000 $\log(10) \approx 46051701.8$
$\log(10^{200000000})$=200000000 $\log(10) \approx 460517018$

(Expected to be larger than $\log(10^{200000})$)

As x in $\log(x)$ grows to the limit, the denominator of the equation also grows extremely large. Even if primes are generated, the frequency of occurrence is extremely low. The generation of Prime Quintuplet is 96/3 times of the 5th power of the generation frequency of primes, and the generation frequency is extremely low.

However, as long as Primes are generated, Prime Quintuplet are generated with a very low frequency.

When the number grows to the limit, the denominator of the expression becomes very large, and primes occur very rarely, but since Prime Quintuplet are 96/3 times of the 5th power of the distribution of Primes, the frequency of occurrence of Prime Quintuplet is very equal to 0.

However, it is not 0. Therefore, Prime Sextuplet continue to be generated.

However, when the number grows to the limit, the probability of the Prime Quintuplet appearing is almost 0 because it is 96/3 times of the 5th power of probability of the appearance of the Prime.
It is a subtle place to say that almost 0 appears.

Use a contradiction method.
If Prime Quintuplet is finite, the Primes is finite.
The probability of Prime Quintuplet 96/3 times of the 5th power of the probability of the appearance of the Prime.
This is contradictory. Because there are an infinite of Primes.

That is, Prime Quintuplet exist forever.

Proof end.
