# On Planck's Spectrum as Function of Wavelength 

Sjaak Uitterdijk<br>SjaakenLutske@hetnet.nl

Abstract-Scrutiniring Planck's spectra as function of frequency and as function of wavelength learns that the last mentioned one leads to baffling results.

## Introduction

Planck's book about this subject, originally written in 1913, has been translated to English as shown in [1]. He presents two types of spectra for the so-called black body radiation, one as function of frequency the other as function of wavelength. The second one turns out to be a scientific disaster.

## The black body power density spectrum as function of frequency resp. wavelength

Planck presented the following two spectra, supplemented with his commentary in Italics:

$$
\mathrm{K}_{v}=h v^{3} c^{-2} /(\exp (h v / \mathrm{kT})-1) \quad \mathrm{W} / \mathrm{m}^{2} / \mathrm{Hz}
$$

"This is the specific intensity of a monochromatic plane polarized ray of the frequency $v$ which is emitted from a black. body at the temperature $T$ into vacuum in a direction perpendicular to the surface."

$$
\mathrm{E}_{\lambda}=\left(h c^{2} \lambda^{-5}\right) /(\exp (h c / \mathrm{k} \lambda \mathrm{~T})-1) \quad \mathrm{W} / \mathrm{m}^{2} / \mathrm{m}
$$

"This is the specific intensity of a monochromatic ray not to the frequency $v$ but, as is usually done in experimental physics, to the wavelength $\lambda . .$. "

The spectrum $\mathrm{E}_{\lambda}$ is incorrect for the following 3 reasons:
1 the maximum of $K_{v}$ is not at the same frequency as of $E_{\lambda}$
$2 \quad K_{v}$ and $E_{\lambda}$ show a completely incomprehensible relationship
3 the dimension of $E_{\lambda}$ is meaningless/unphysical
ad 1 The maximum of $K_{v}$ is found for $d K_{v} / d v=3 v^{2} \cdot\left(e^{a v}-1\right)^{-1}-v^{3} \cdot\left(e^{a v}-1\right)^{-2 \cdot} \cdot e^{a v} \cdot a=3-a v /\left(1-e^{-a v}\right)=0$
Approximating $1-e^{-a \nu} \quad$ by $\quad a v-a^{2} v^{2} / 2 \quad$ leads to $v=(4 / 3) \cdot \mathrm{kT} / \mathrm{h} \mathrm{Hz}$
Approximating $1-e^{-a v} \quad$ by $\quad a v-a^{2} v^{2} / 2+a^{3} v^{3} / 6 \quad$ leads to $v=4 \cdot \mathrm{kT} / h \mathrm{~Hz}$
Approximating $\left(e^{\text {av }}-1\right)^{-1}$ by $\quad e^{-a v}$ directly in $K_{v} \quad$ leads to $v=3 \cdot \mathrm{kT} / \mathrm{h} \mathrm{Hz}$
The numerical calculation of $K_{v}$ shows that the latter approximation is accurately close to reality. This approximation applied to $\mathrm{E}_{\lambda}$ and replacing $1 / \lambda$ by y, leads to $\mathrm{E}_{\mathrm{y}}=h c^{2} \mathrm{y}^{5} \cdot \mathrm{e}^{-\mathrm{by}}$, with $\mathrm{b}=h c / \mathrm{kT}$. $\mathrm{dE}_{\mathrm{y}} / \mathrm{dy}=5 \mathrm{y}^{4} \cdot \mathrm{e}^{-\mathrm{by}}+\mathrm{y}^{5 \cdot} \cdot(-\mathrm{b}) \cdot \mathrm{e}^{-\mathrm{by}}=5-\mathrm{y} \cdot \mathrm{b}=0$, so the maximum of $\mathrm{E}_{\lambda}$ is found at $v=5 \cdot \mathrm{kT} / h$.
ad 2 The cause of the deviation from $v=3 \cdot \mathrm{kT} / b$ is only the power 5 of $\lambda$ in $\mathrm{E}_{\lambda}$.
Writing blindly $h c^{2} / \lambda^{3}$ instead of $h c^{2} / \lambda^{5}$ would lead to the dimension W/m instead of W $/ \mathrm{m}^{2} / \mathrm{m}$ of $\mathrm{E}_{\lambda}$. The solution to this problem has to be found in the introduction of a constant with dimension $\mathrm{m}^{-2}$, instead of the introduction, as Planck did, of $\lambda^{-2}$. However such a constant does not exist.
In order to show the mutual completely incomprehensible relationship between $K_{v}$ and $\mathrm{E}_{\lambda}$ there maximum values are compared.
Applying $v=3 \cdot \mathrm{kT} / h$ in $K_{v}$ results in $K_{v \max }=9.5 \cdot 10-20 \cdot \mathrm{~T}^{3} \quad \mathrm{~W} / \mathrm{m}^{2} / \mathrm{Hz}$
Applying $v=5 \cdot \mathrm{kT} / h$ in $\mathrm{E}_{\lambda}$ results in $\mathrm{E}_{\lambda \max }=2.0 \cdot 10-6 \cdot \mathrm{~T}^{5}$
$\mathrm{W} / \mathrm{m}^{2} / \mathrm{m}$
These results show their mutual completely incomprehensible relationship and that $\mathrm{E}_{\lambda}$ has to be rejected.

Ad3 The correct expression for $E_{\lambda}$ is found when $\nu^{3}$ in $K_{\nu}$ is be replaced by $c^{3} / \lambda^{3}$ and $E_{\lambda}$ ritten as $E_{v}$ :

$$
\mathrm{E}_{\mathbf{v}}=\left(b c / \lambda^{3}\right) /(\exp (b c / \mathrm{k} \lambda T)-1) \quad \mathrm{W} / \mathrm{m}^{2} / \mathrm{Hz}
$$

The integration of this spectrum has of course to be done w.r.t. the frequency. In a numerical situation, where $\lambda$ is taken as the primary variable, $\Delta \lambda=\lambda_{n}-\lambda_{n-1}$ has to be replaced by $\Delta \nu=c \cdot\left(1 / \lambda_{n-1}-1 / \lambda_{n}\right)$.
This result forces us to conclude that the dimension W/m²/m of Planck's spectrum $\mathrm{E}_{\lambda}$ has to be rejected.

Given the surprising accuracy of the simplified spectra the graphs of $K_{v}$ and $E_{v}$ have been drawn for both the original and the simplified situation.

Regarding the outcome of the integral of the spectra: the original, carried out by extremely esoteric mathematics, see reference [2], leads to $\pi^{4} / 15 \cdot b^{-3} c^{-2} \mathrm{k}^{4} \cdot \mathrm{~T}^{4}$, the simple one to $6 \cdot b^{-3} c^{-2} \mathrm{k}^{4} \cdot \mathrm{~T}^{4} \mathrm{~W} / \mathrm{m}^{2}$.

Figure of $K_{v}$

Figure of $E_{v}$

## Conclusion

The originally by Planck proposed spectrum as function of wavelength has to be rejected and replaced by the one as function of frequency, in which the variable frequency is replaced by $c$ divided by wavelength.
