

# The Ø 40 x 33 km Pilbara Crater near Port Hedland ( NW-Australia )

- RAMAN Spectra of selected Rock Samples - by Harry K. Hahn, 30.6.2021 -

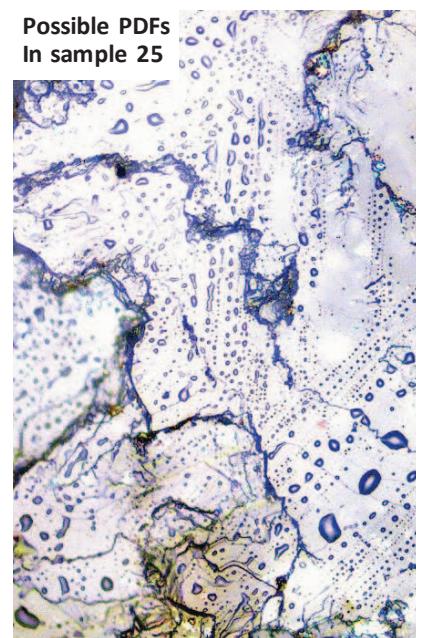

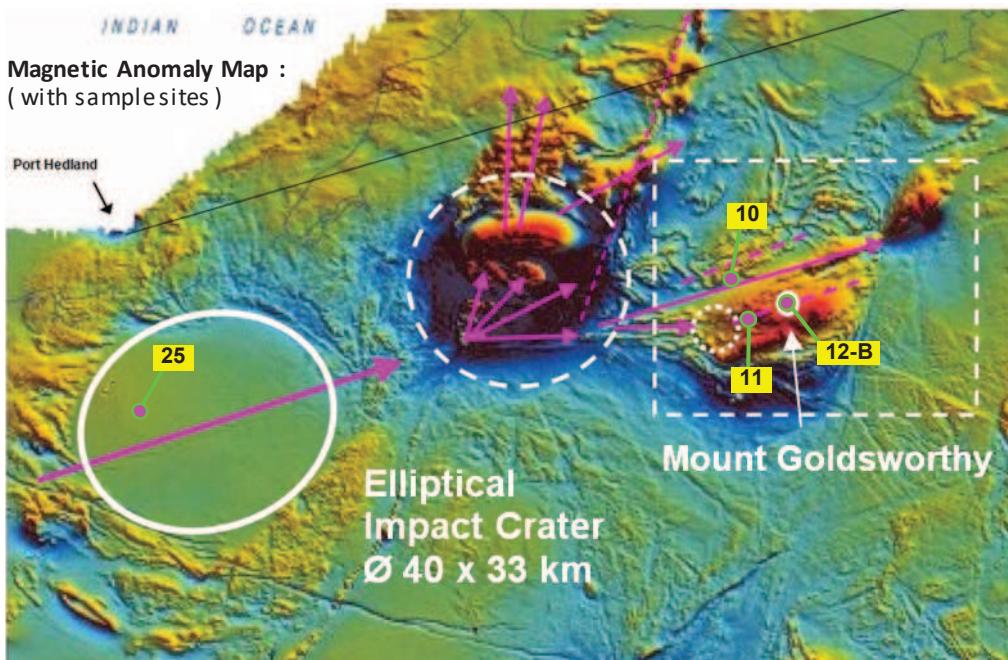

Raman spectra of quartz samples collected at the sample sites **25**, **11** and **10** provide first evidence for this Ø40x33km elliptical Impact Crater and for the secondary impact-structures produced by this crater. The impact crater is located near the town Port Hedland in Western Australia. Because of the elliptical shape of the crater it is the result of an oblique impact. That means the impactor which formed the crater impacted in a very shallow angle of probably less than 10°. → [Here my more detailed : Study](#)

Because of the shallow impact angle, fragments of the impactor were ejected from the crater and caused complex secondary impact structures 40 km and 80 km further east of this elliptical crater. One of the secondary impact structures is Mount Goldsworthy which is a famous Iron Ore Mine that contained the world's richest deposits of ferrous (iron)-ore with a share of up to 68 % iron.

Beside the Raman spectra which I present as evidence and first verification for this elliptical crater and its secondary impact structures, there is additional geo-physical evidence coming from the magnetic anomaly map ( see image below ), which clearly indicates the elliptical crater, including a center-line structure in the crater, and which shows the secondary impact structures in detail.

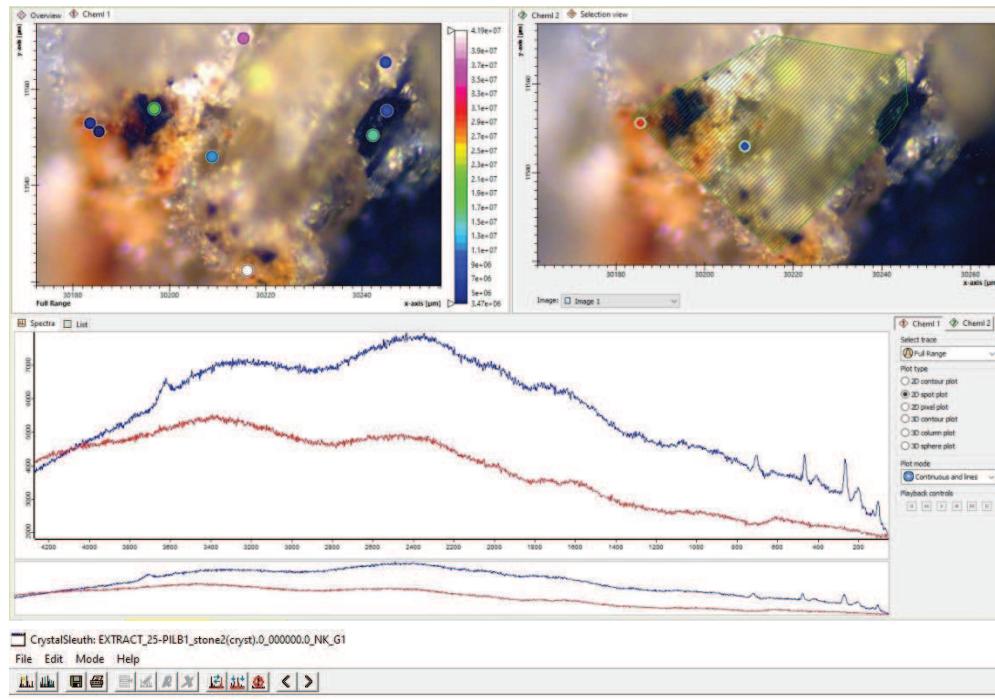

The shifts of the main Raman bands ( peaks ) to the lower frequencies **463**, **261**, **198/205** and **125 cm<sup>-1</sup>** in a quartz sample from the sample site 25 ( Stone 2 ), which was collected inside the crater area, clearly indicates that the quartz was exposed to a **shock pressure of around 22 GPa**. ( see explanation in the Appendix at [page 19](#) ). Further evidence for an impact event is provided by quartz samples from sample sites 10 & 11 which are located in the area of the secondary impact-structure Mt Goldsworthy. These quartz samples show shifts of the main Raman bands ( peaks ) to the lower frequencies **463**, **260**, **204** and **126 cm<sup>-1</sup>** which also indicates a **shock pressure of around 22 GPa**. Further evidence comes from a microscopic image of sample 25 (stone 3) which indicates planar deformation features (PDFs). All spectra were made with a **BRUKER Senterra-II Raman Microscope** ( wavenumber precision <0.1cm<sup>-1</sup> )

- Images of the analysed rock samples and photos of the sample sites are in the Appendix at [page 17](#).
- A general summary to all analysed sample sites is provided by **Part 6 (P6)** of my **PTI-hypothesis (P1)**
- More images of all sample sites are available on [www.permiantriassic.de](http://www.permiantriassic.de) or [www.permiantriassic.at](http://www.permiantriassic.at)

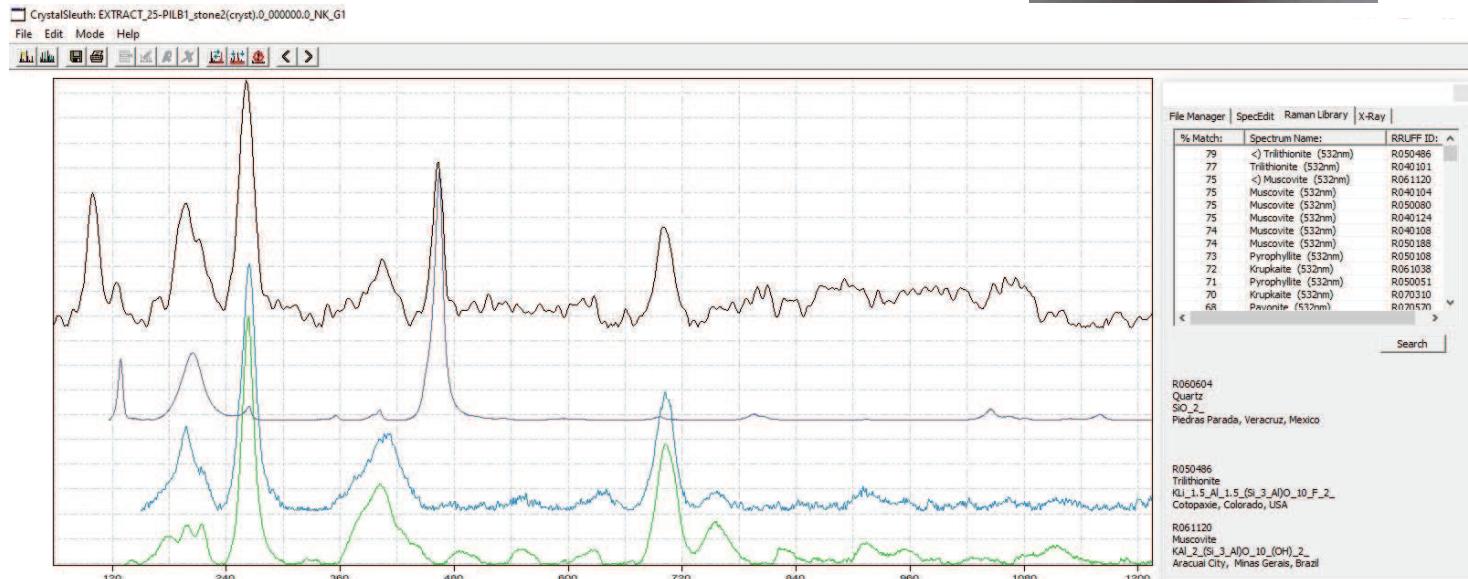

## Sample Site 25 : Stone 2\_spectra 2 indicates : Quartz & Trilithionite, Muscovite (→ see RRUFF\_CS results )

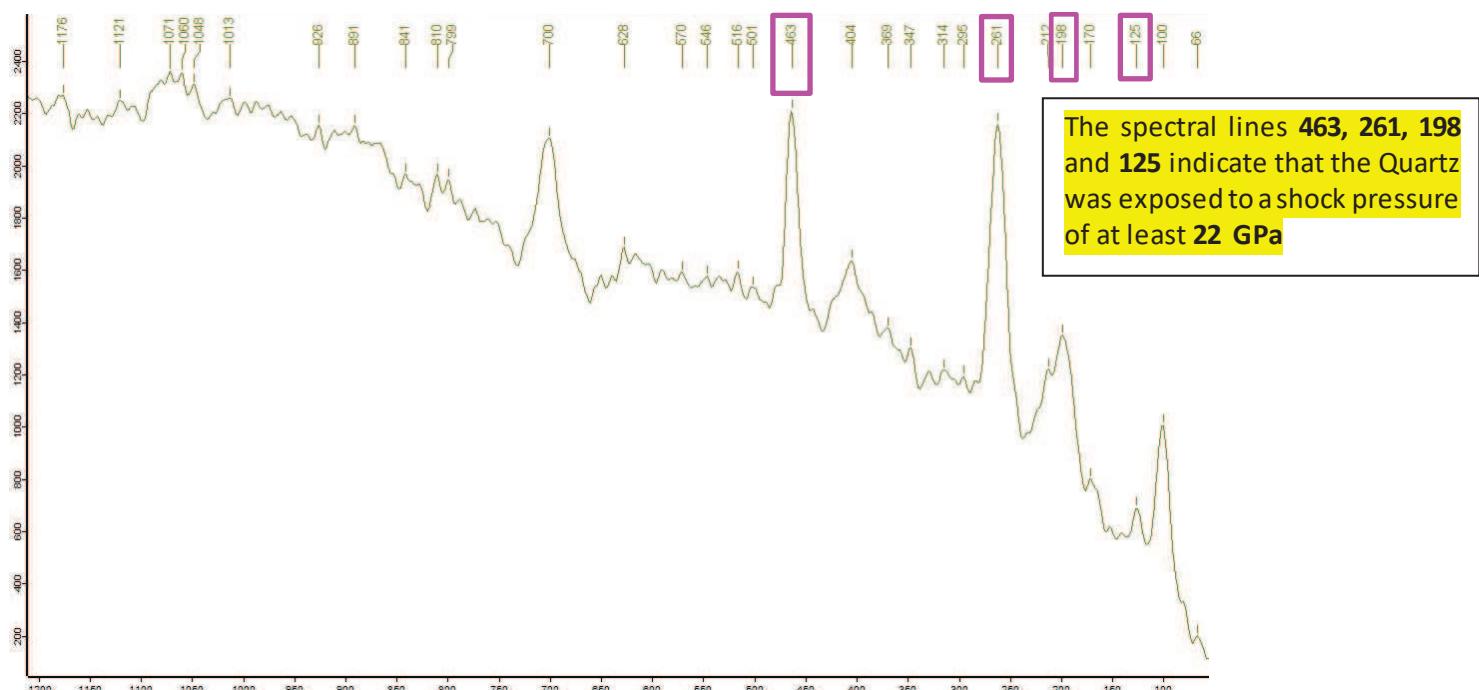

The Spectrum indicates a mixture of Quartz and Trilithionite / Muscovite

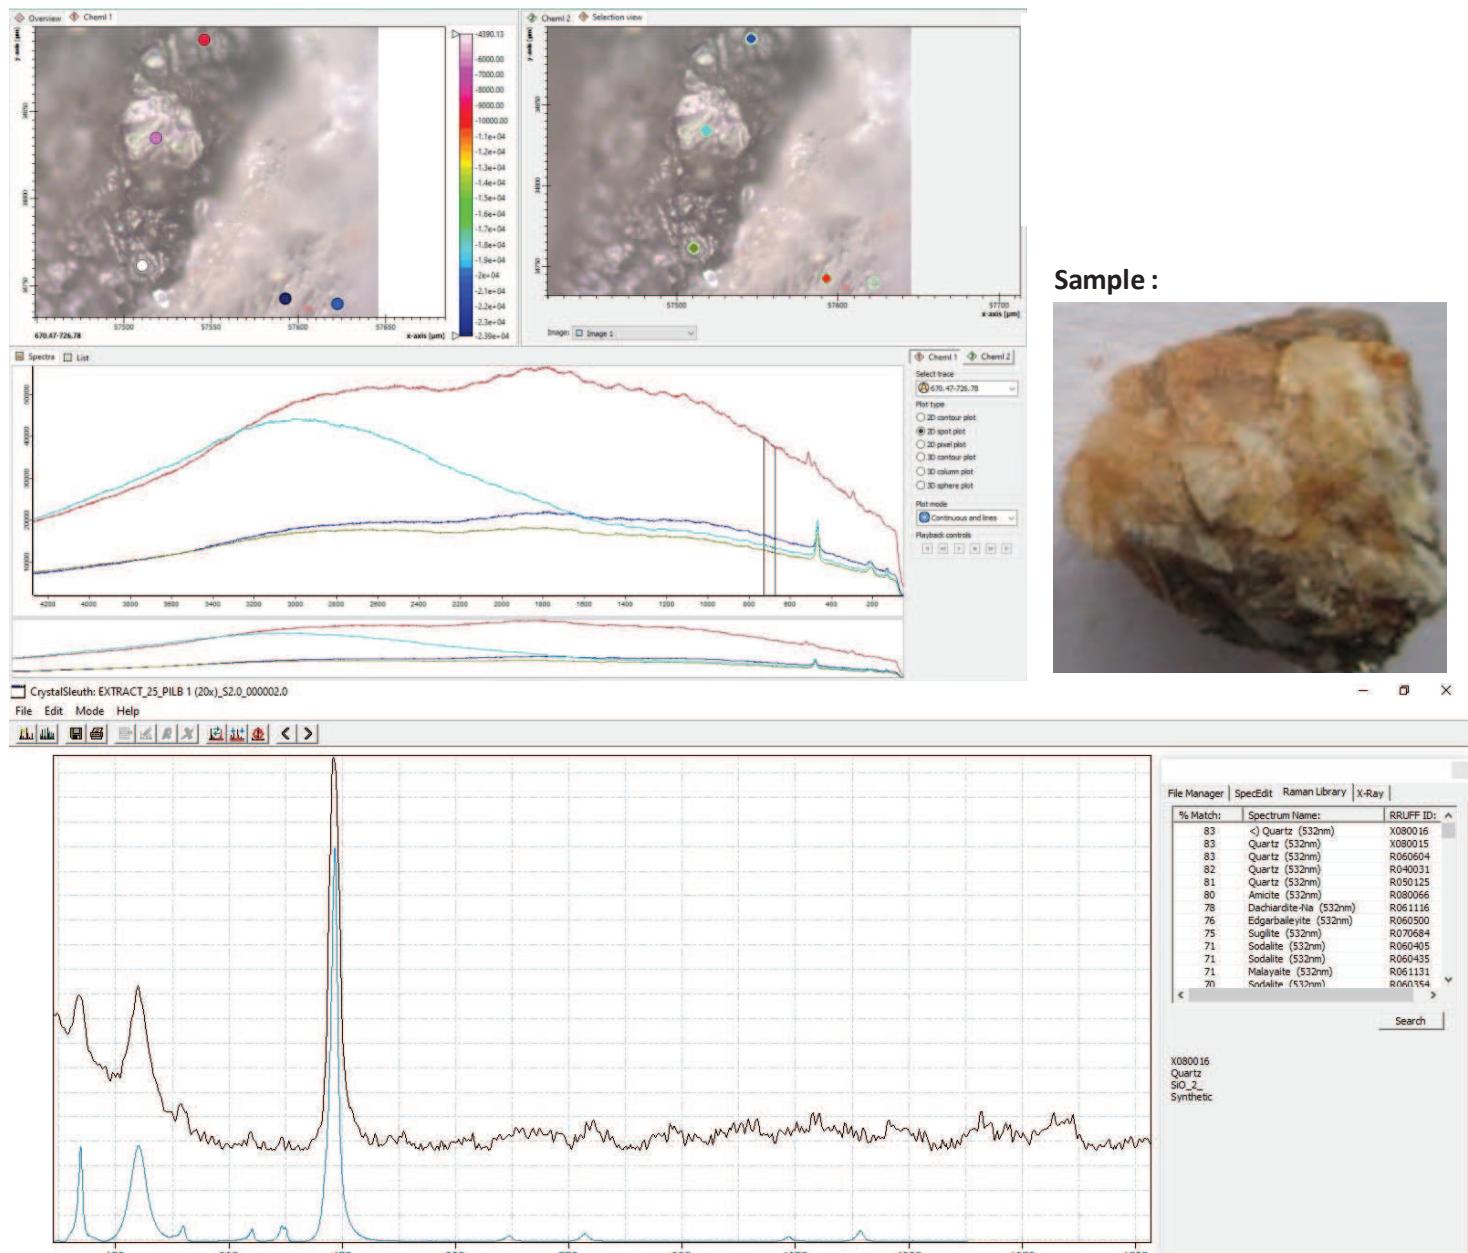

Sample :

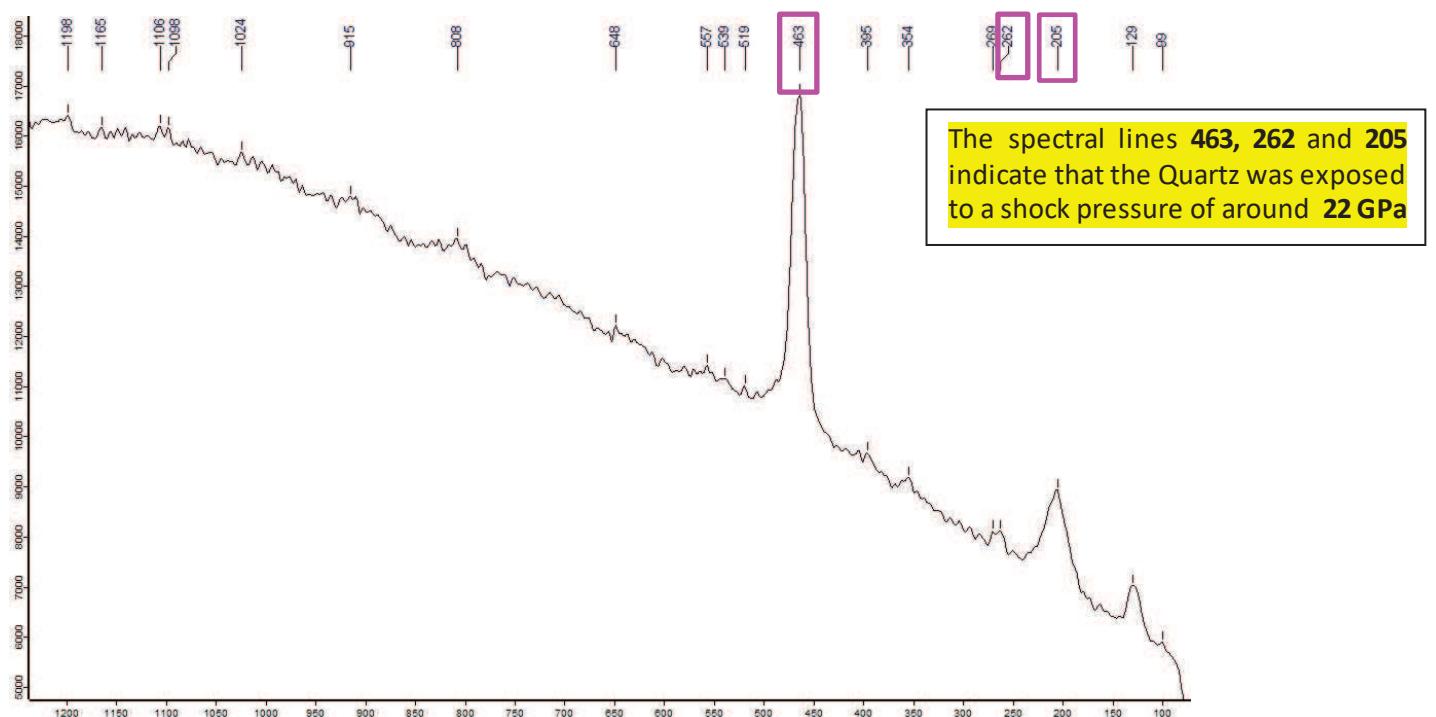

Indication for a shock event are the shifts of the marked Quartz spectral lines towards 463, 261, 198 and 125

## Sample-Site 25 : Stone 2\_spectra 3 indicates: Quartz (→ see RRUFF\_CS results )

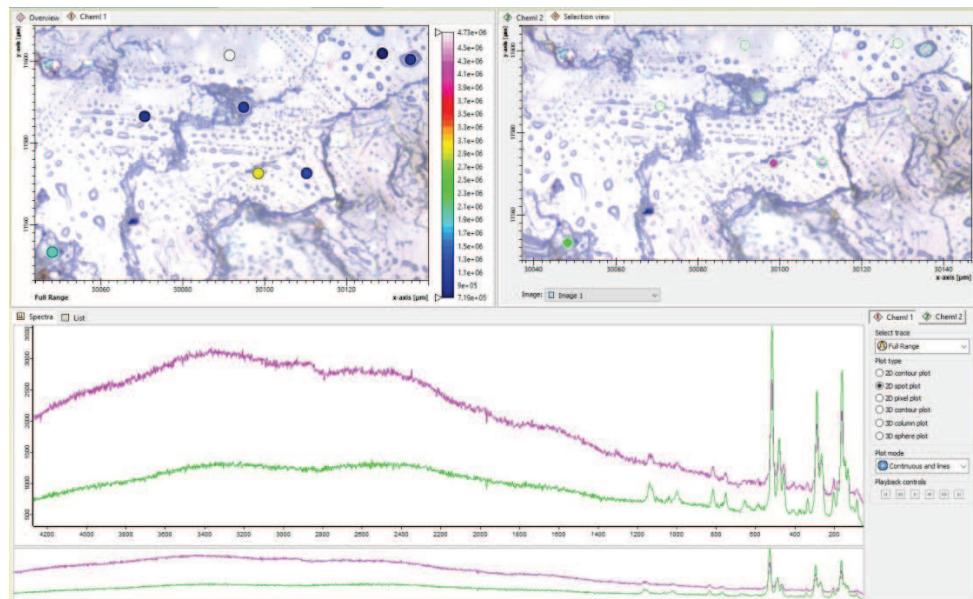

Indication for a shock event are the shifts of the marked Quartz spectral lines towards 463, 262 and 205

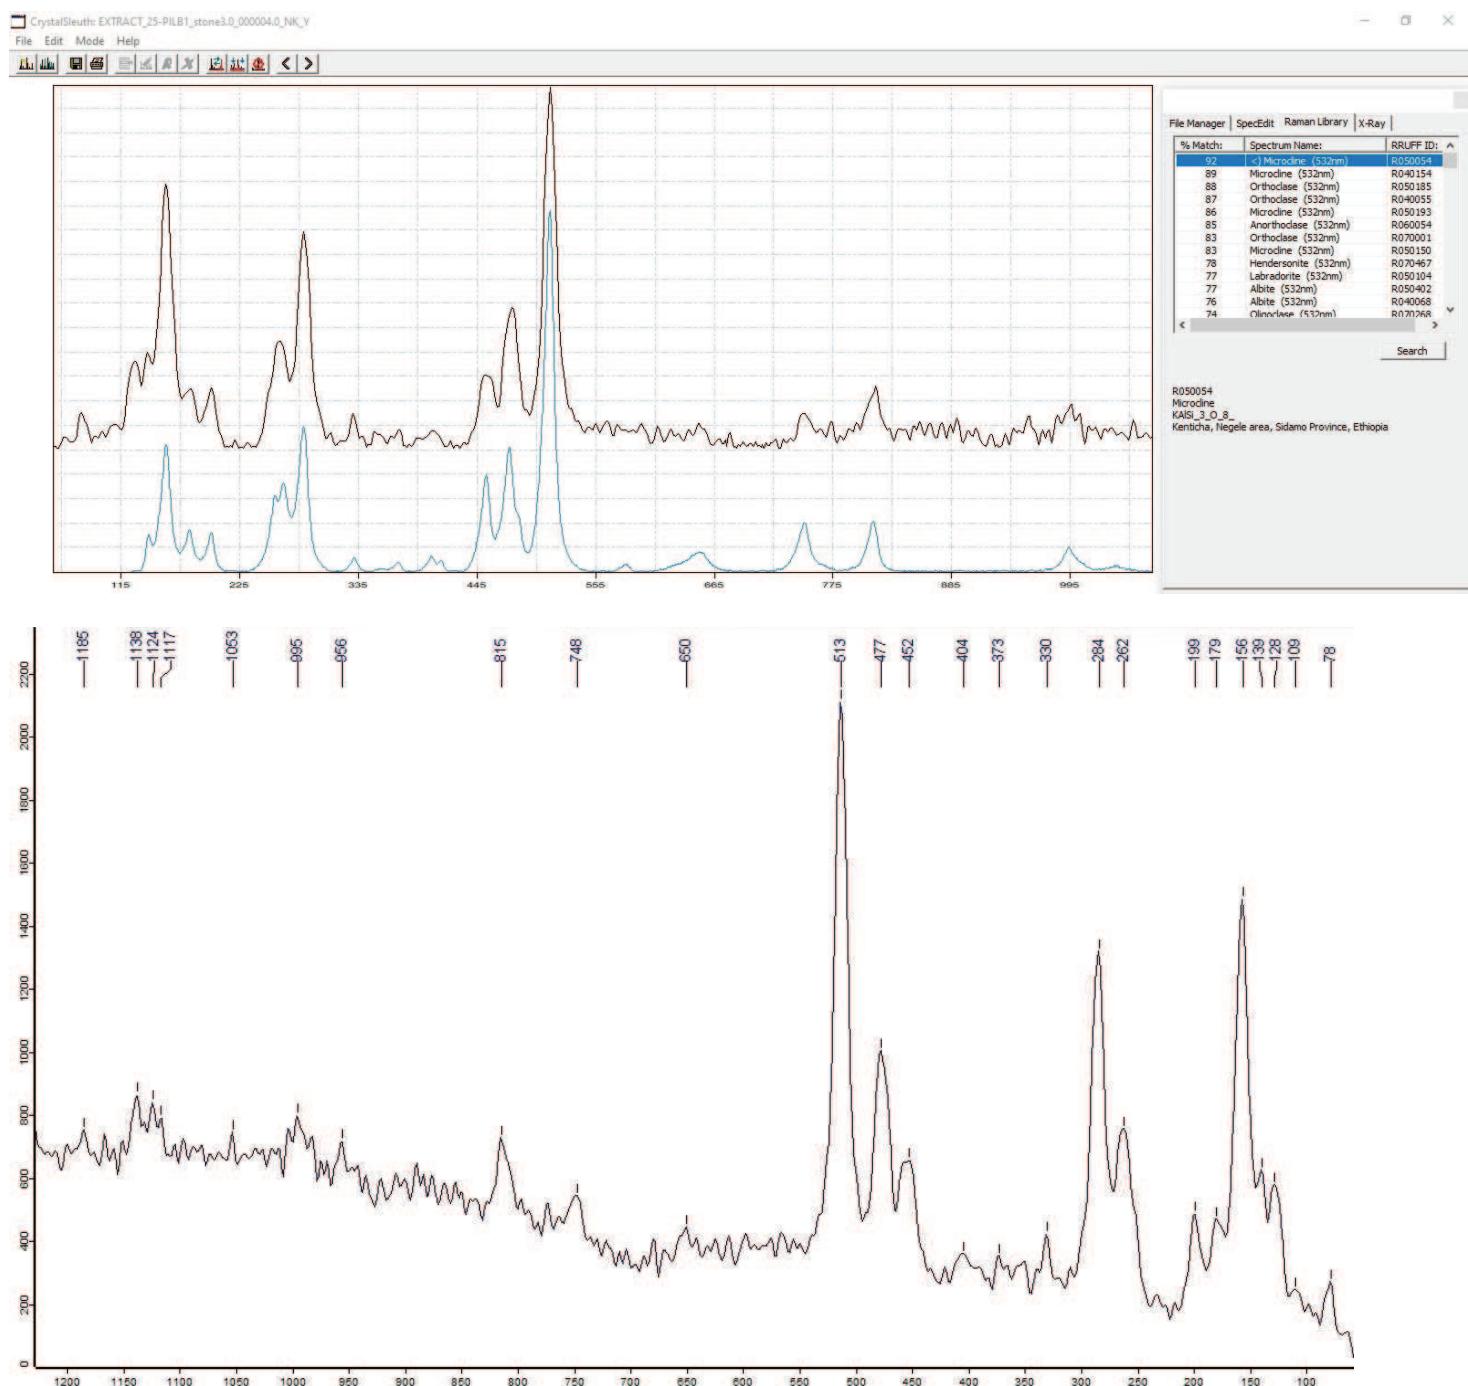

## Sample Site 25 : Stone 3\_spectra 2 indicates : Microcline

(→ see RRUFF\_CS results )

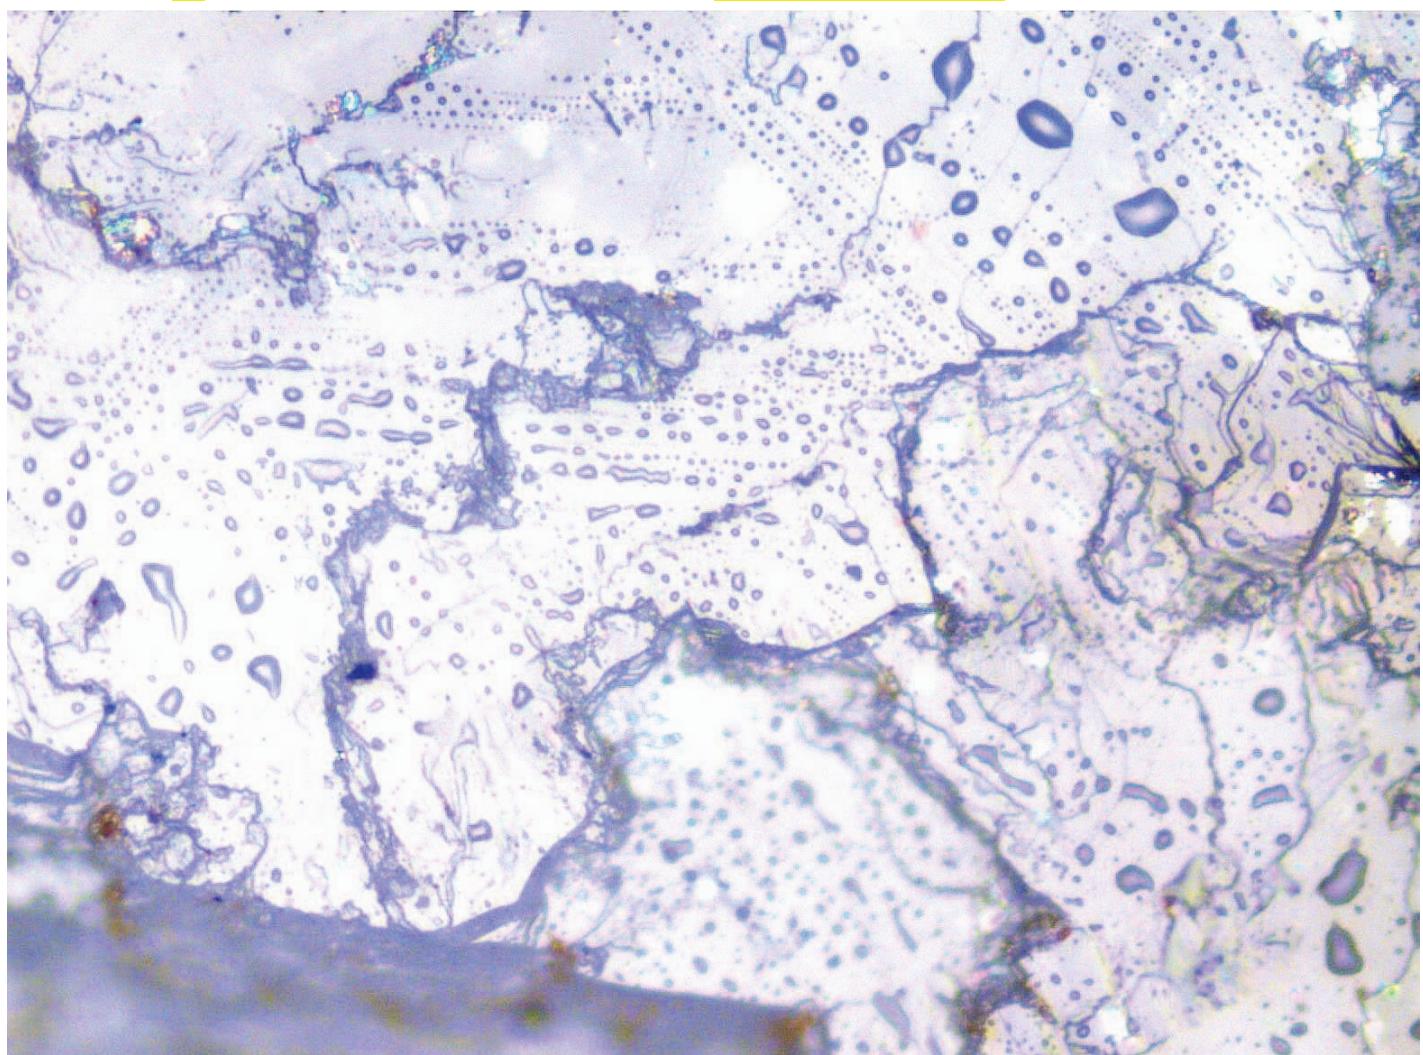

Note the sets of parallel fractures in the microscopic image, which are orientated in defined angles to each other ! This indicates PDFs (Planar Deformation Features) in the sample

Sample :

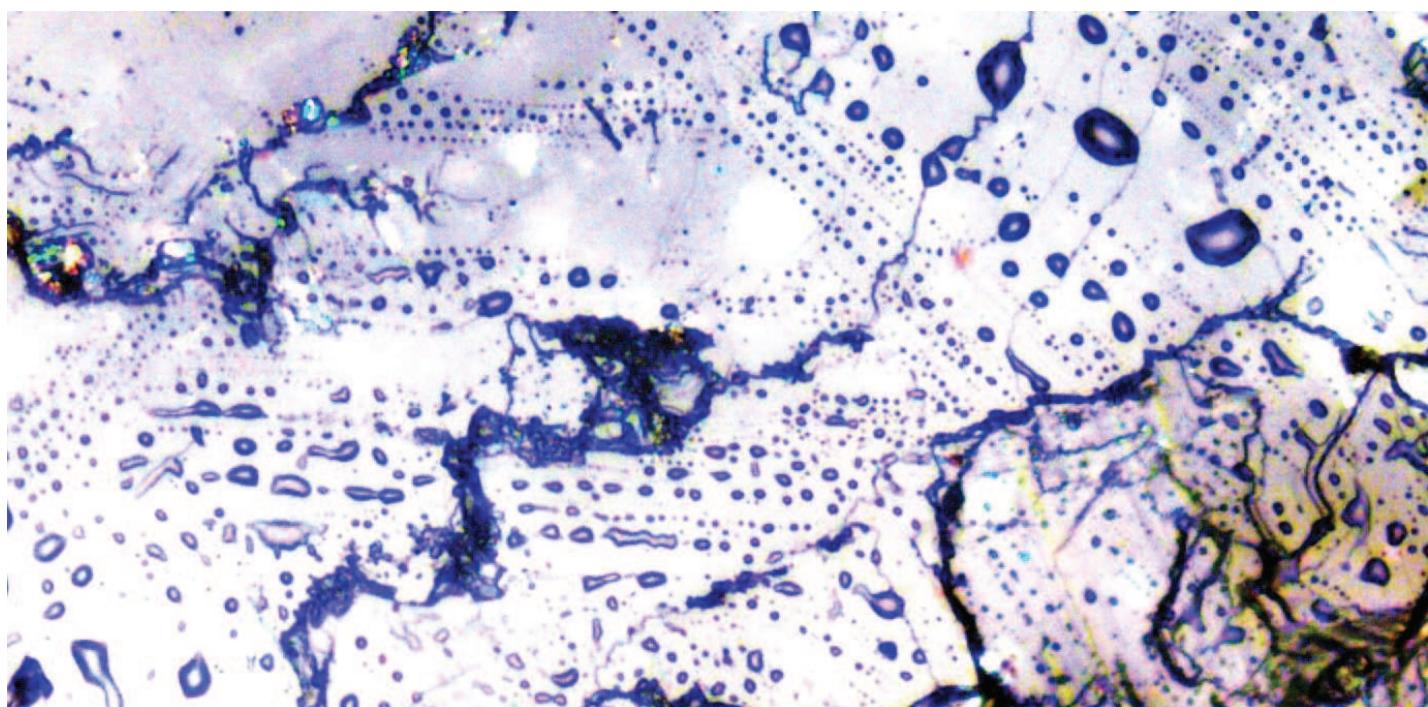

**Microscopic Images : Sample from Site 25 → original state ( no preparation for analysis )**

**Sample Site 25 : Stone 3\_spectra 2 : Microcline → PDFs visible in sample - Image size : ~ 120 x 80 µm**

**Sample Site 25 : Stone 3\_spectra 2 : Microcline → PDFs Visible in sample - Image size : ~ 100 x 50 µm**

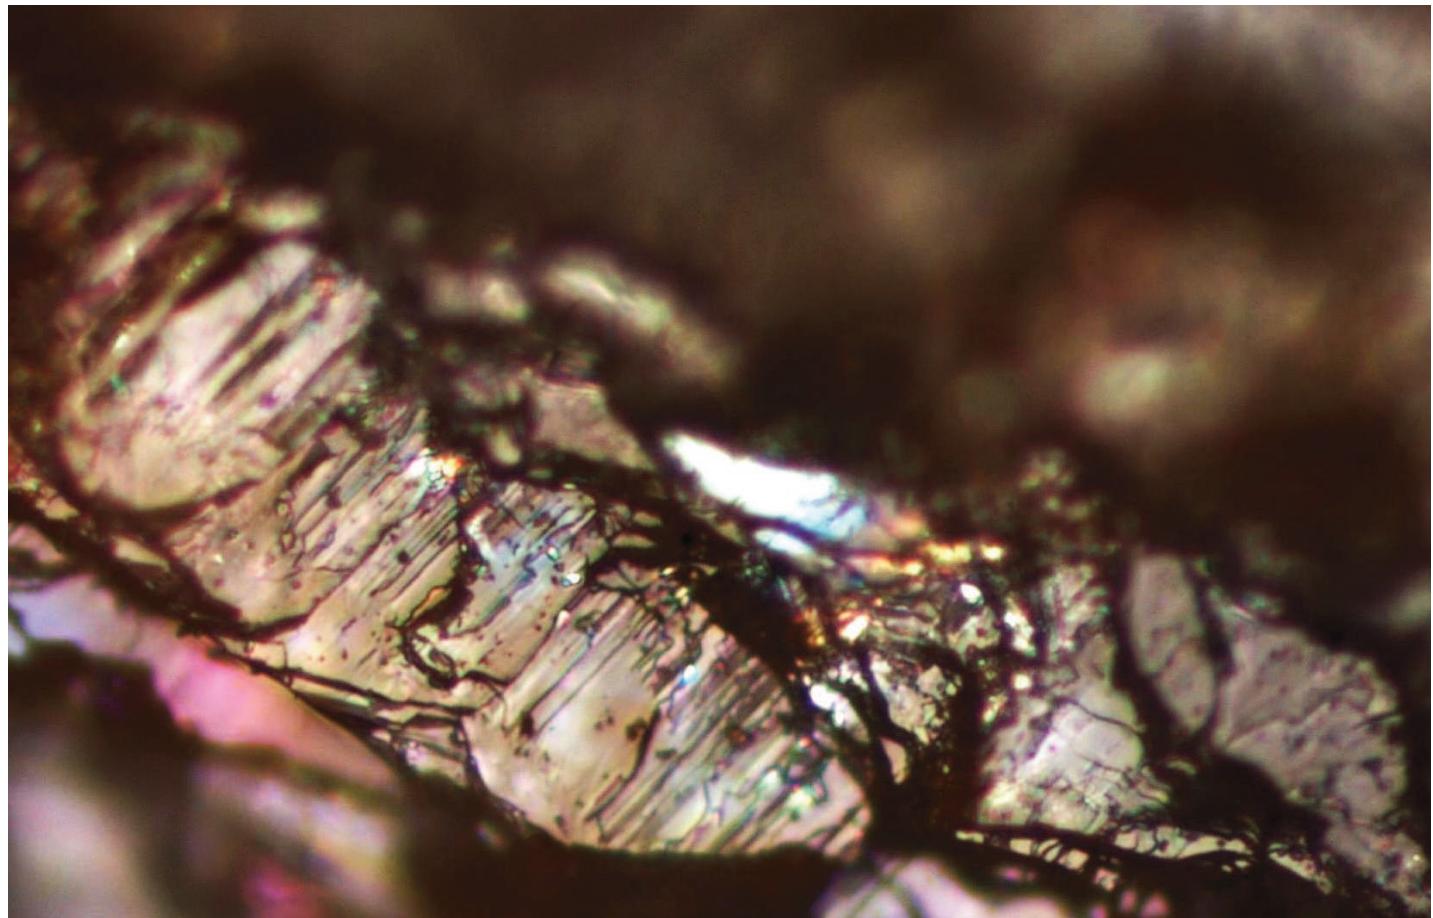

**Detail :** sets of parallel fractures which are orientated in defined angles to each other ! Indicating PDFs in the sample

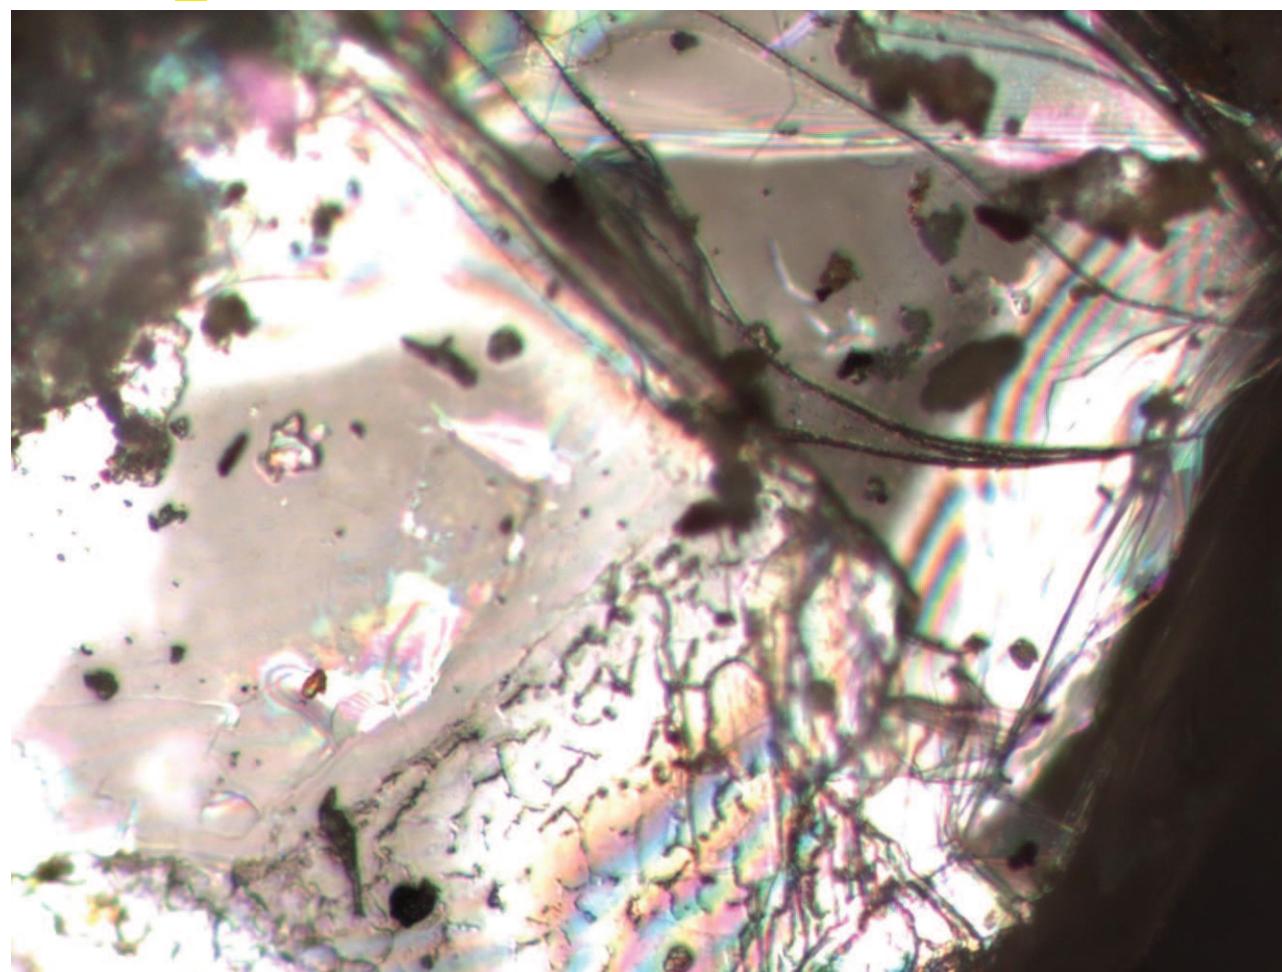

**Microscopic Images : Sample from Site 25 → original state ( no preparation for analysis )**

**Sample Site 25 : Stone 3 : Microcline, Orthoclase - Image size : ~ 150 x 100 µm**

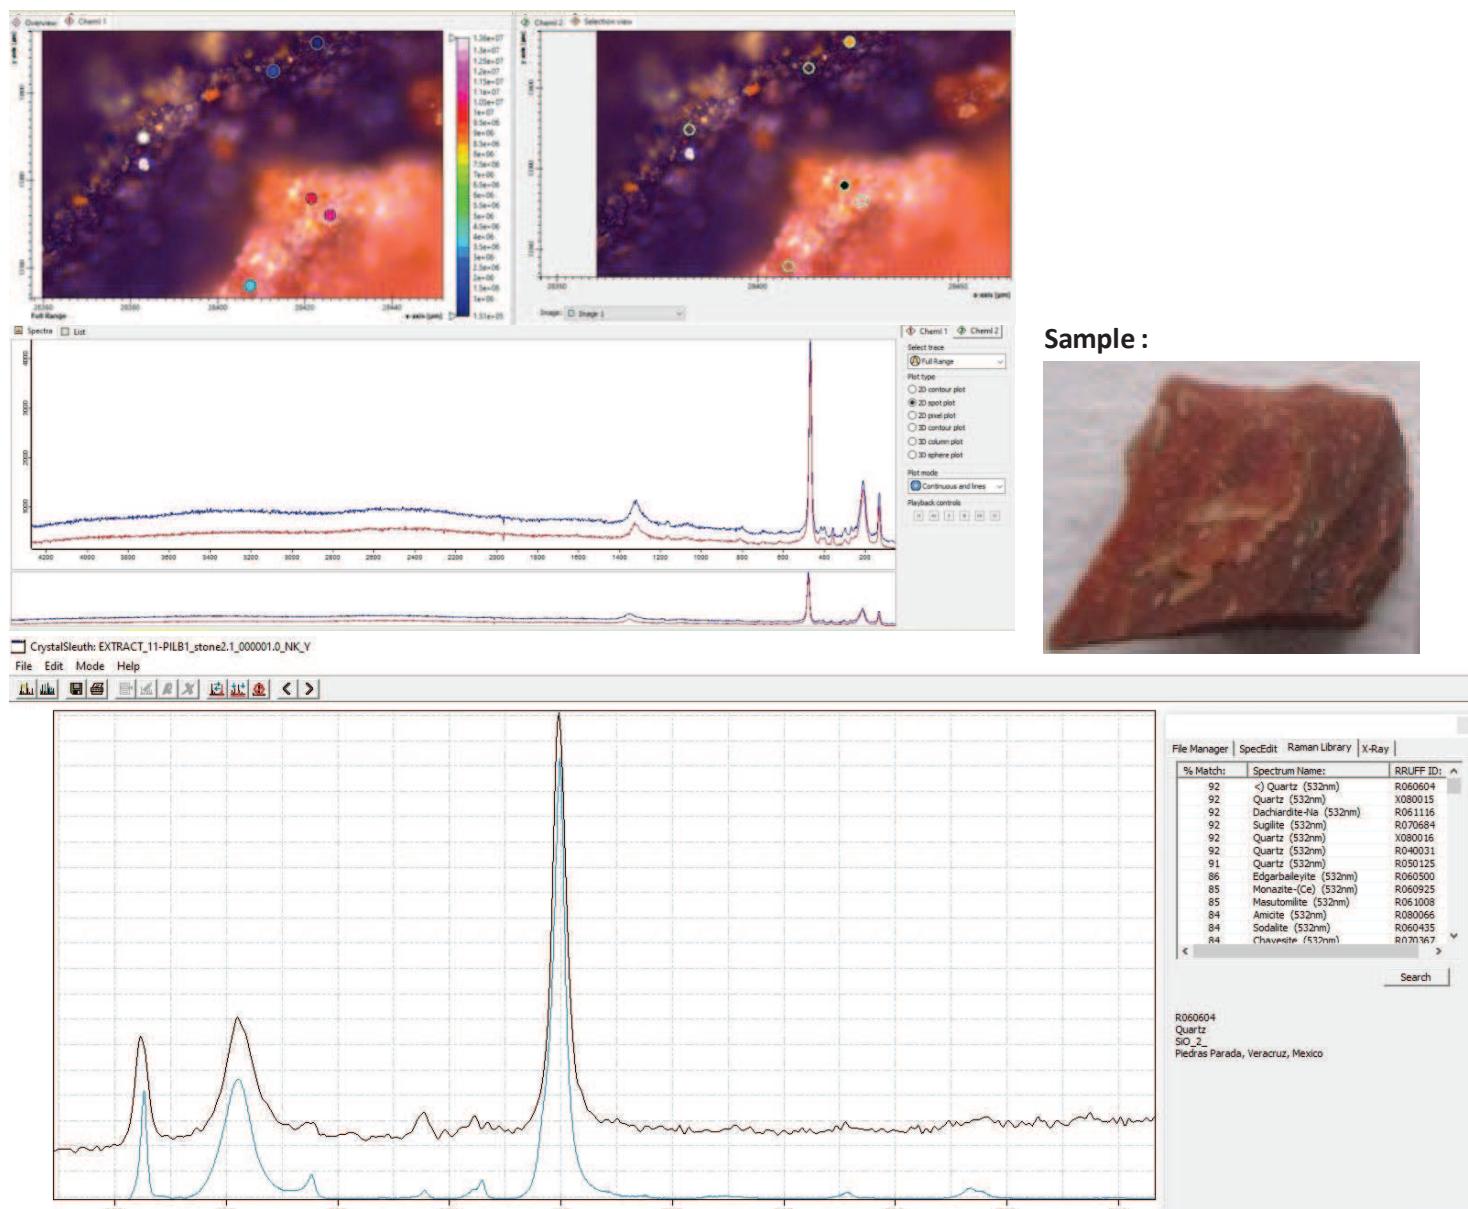

**Detail :** sets of parallel fractures which are orientated in defined angles to each other ! Indicating PDFs in the sample

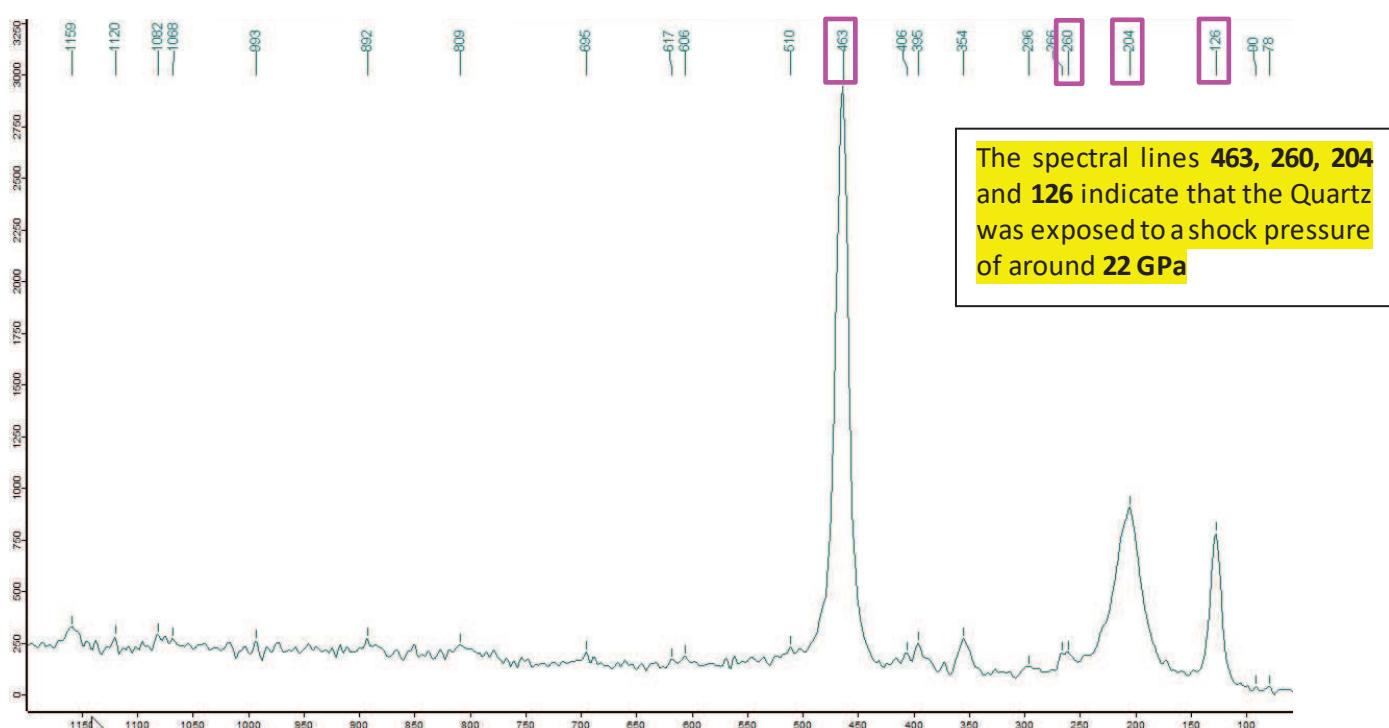

**Sample Site 25 : Stone 2 : Quartz - Image size : ~ 200 x 150 µm**

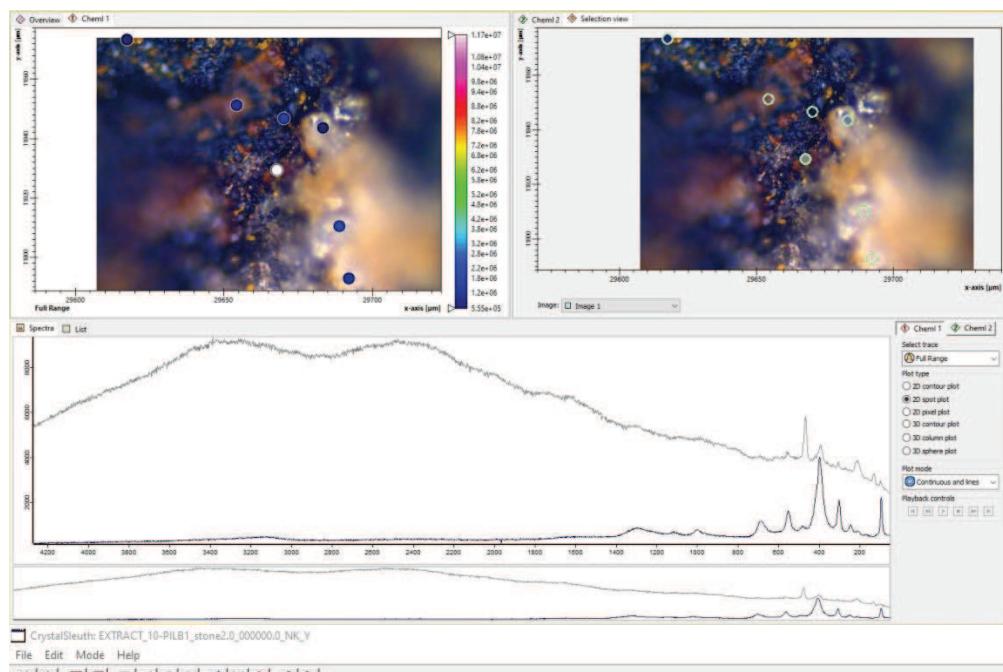

Sample Site 11 : Stone 2\_spectra 1 indicates : Quartz (→ see RRUFF\_CS results )

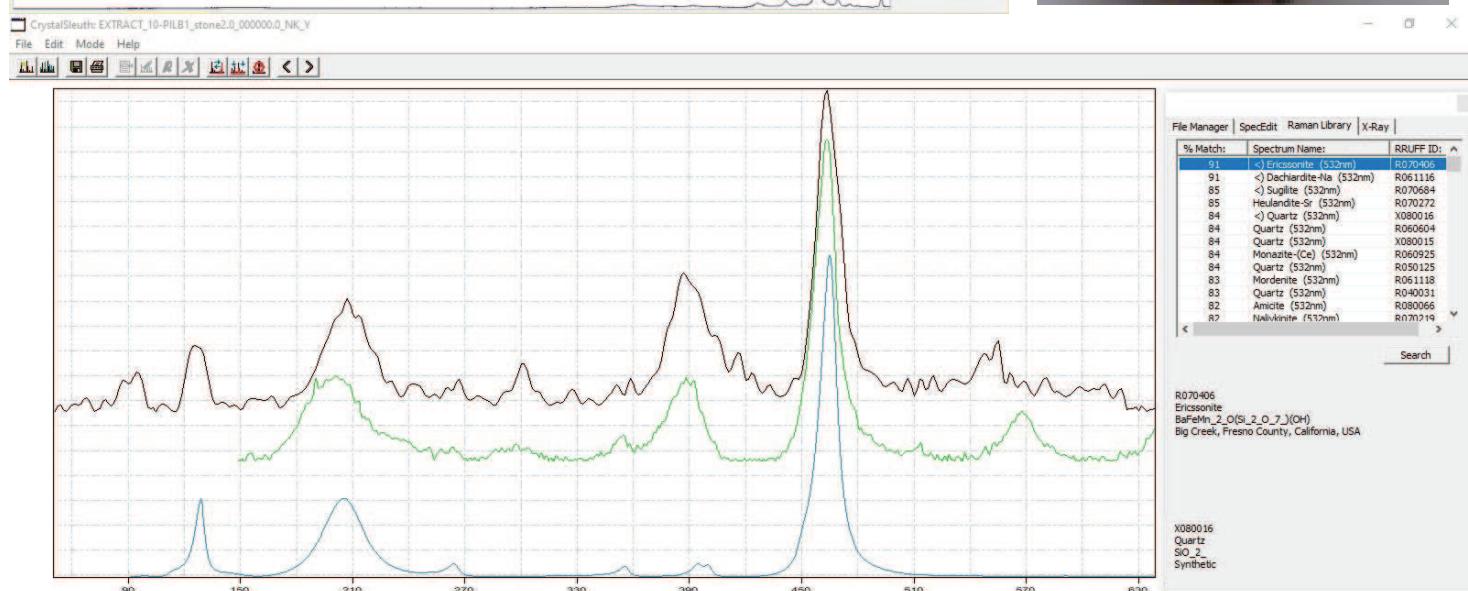

Indication for a shock event are the shifts of the marked Quartz spectral lines towards 463, 260, 204

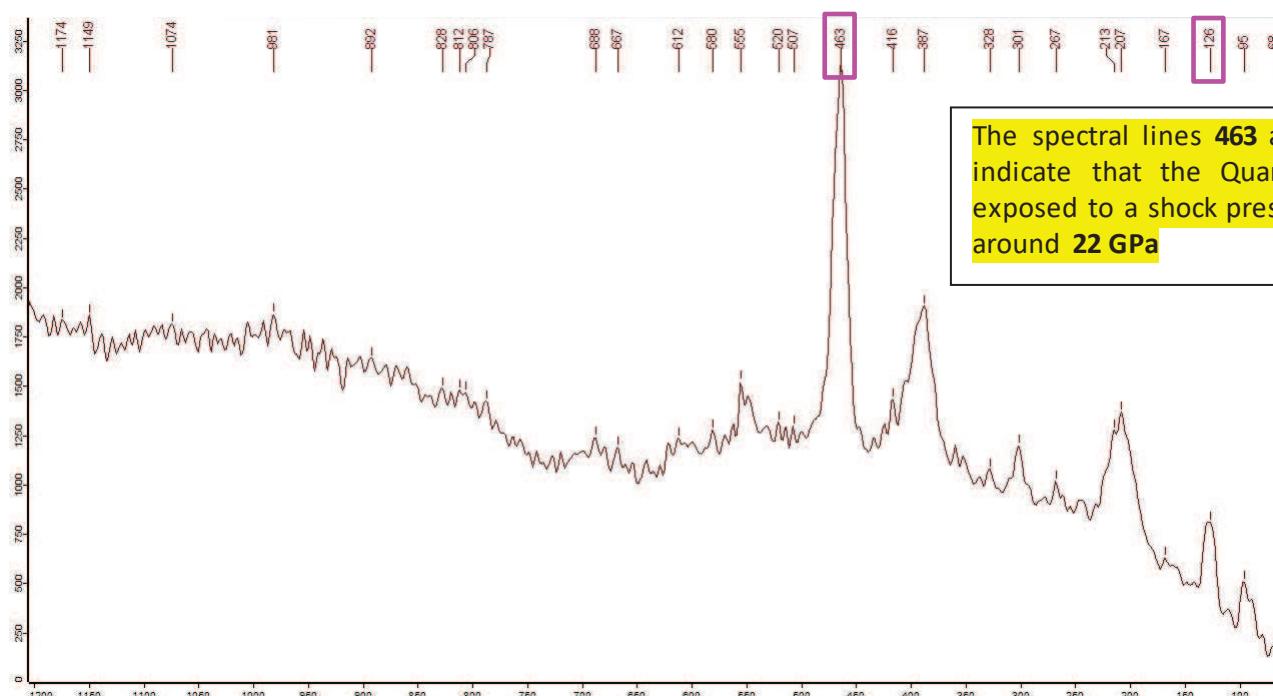

Sample Site 10 : Stone 2\_spectra 1 indicates : Quartz , Ericssonite. (→ see RRUFF\_CS results )

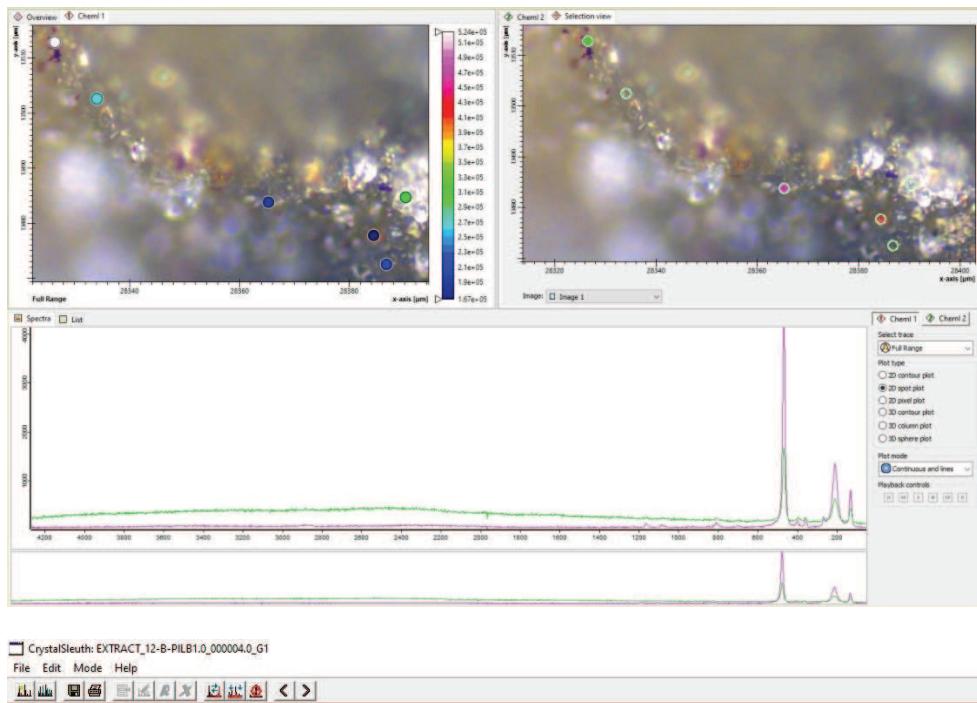

Sample :

Indication for a shock event are the shifts of the marked Quartz spectral lines towards 463 and 126

Sample Site 12-B : Stone 1\_spectra 1 indicates : Quartz (→ see RRUFF\_CS results )

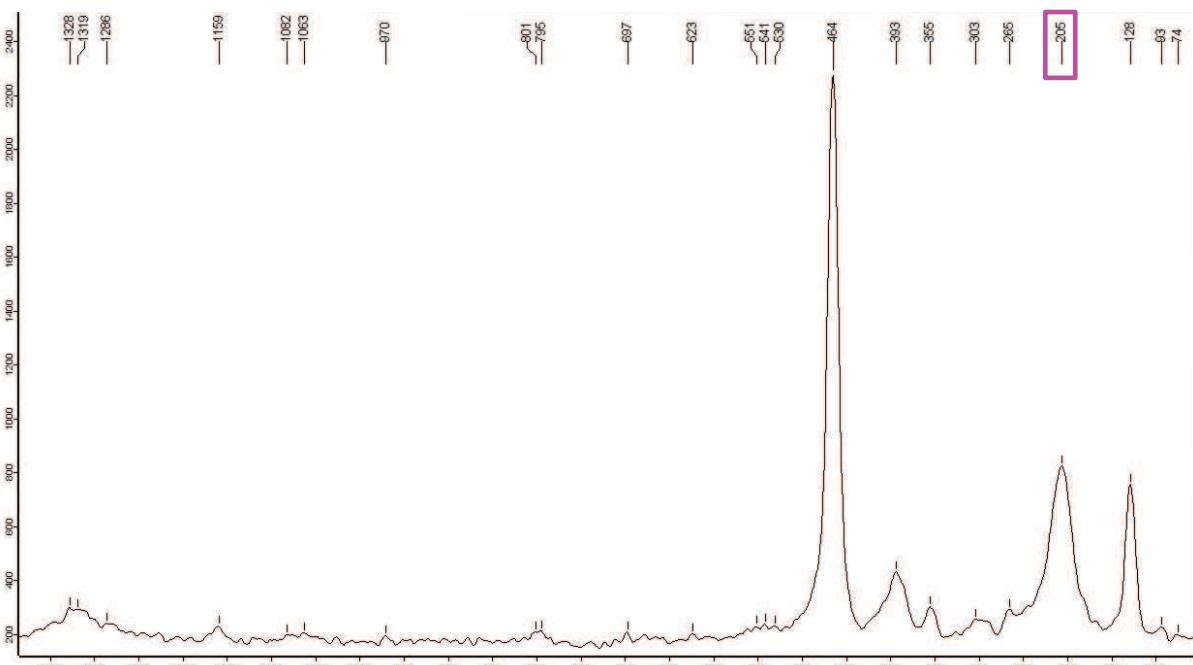

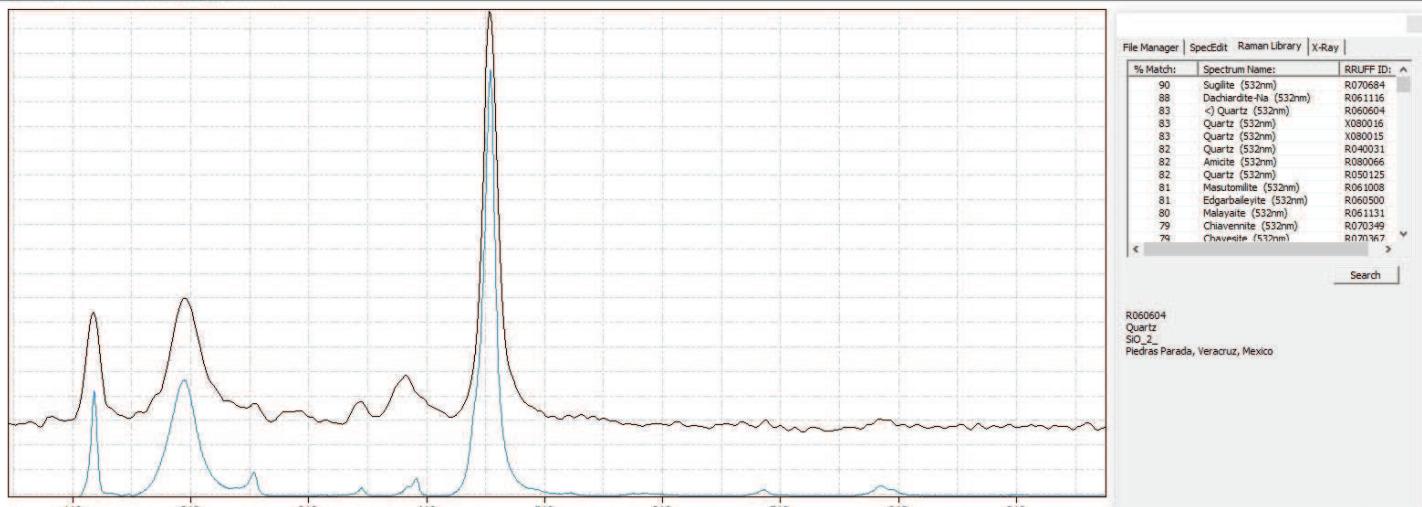

CrystalSleuth: EXTRACT\_12-B-PILB1.0\_000004.0\_G1

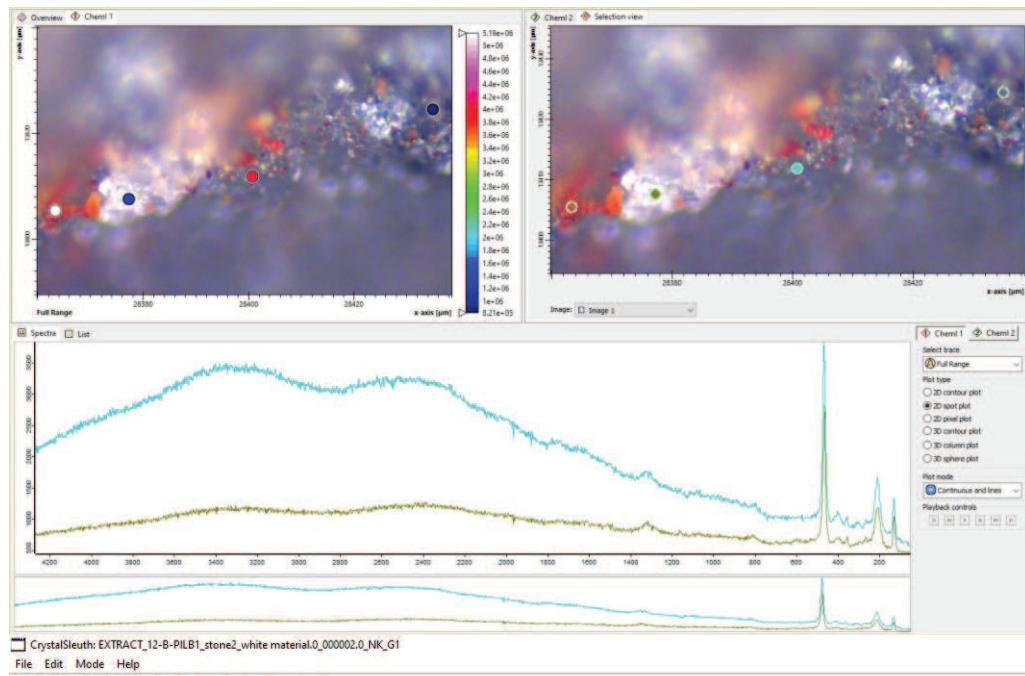

File Edit Mode Help

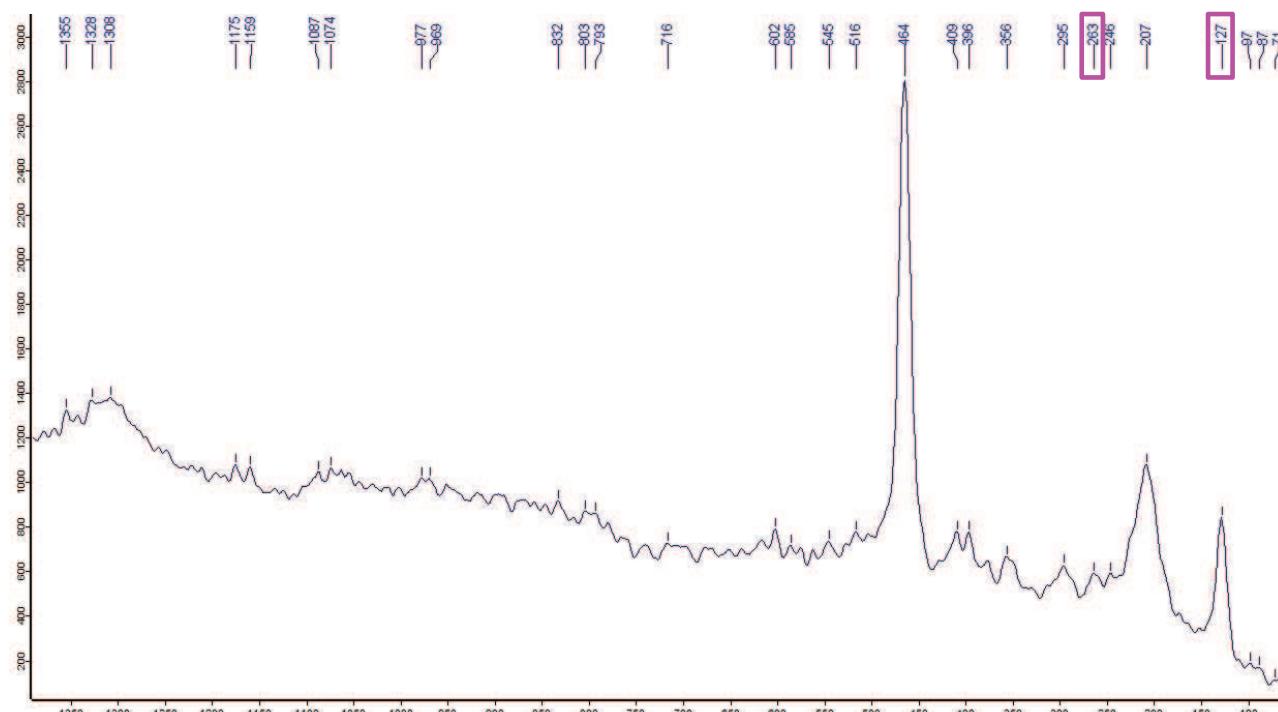

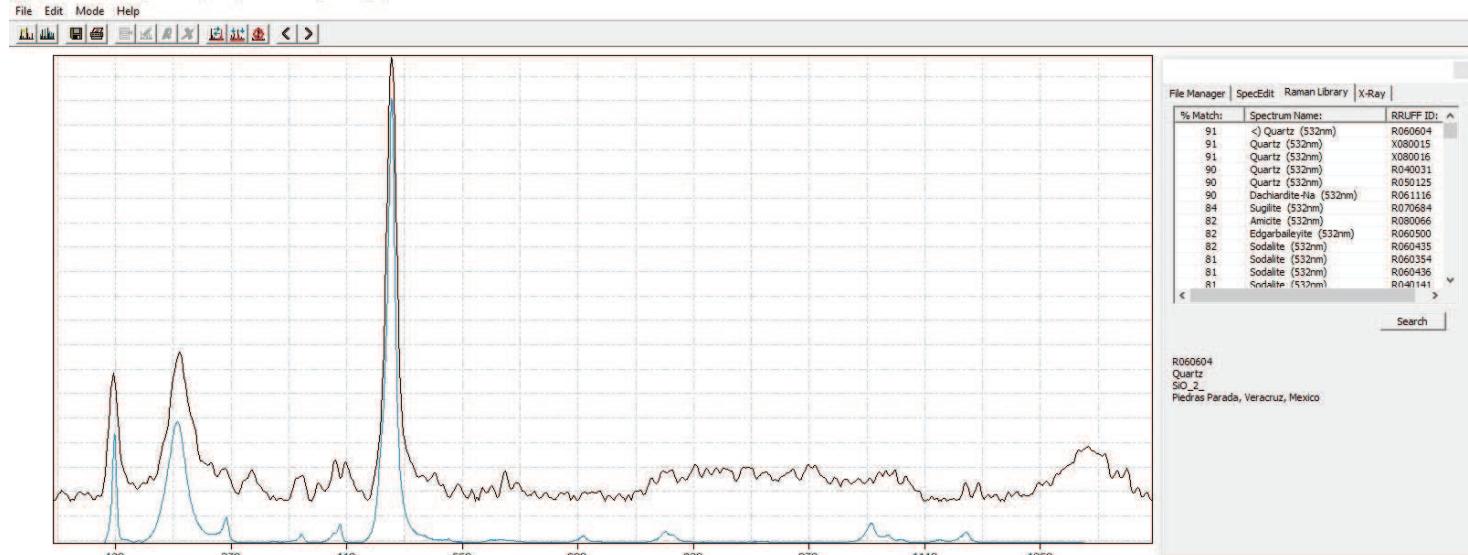

Sample :

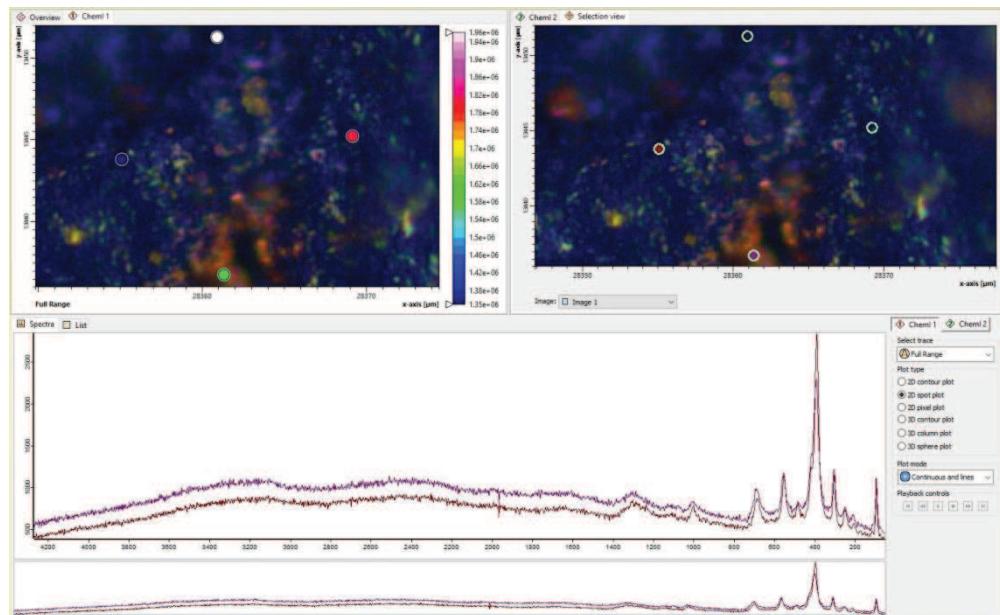

Sample Site 12-B : Stone 2\_spectra 1 ( white mineral ) indicates : Quartz (→ see RRUFF\_CS results )

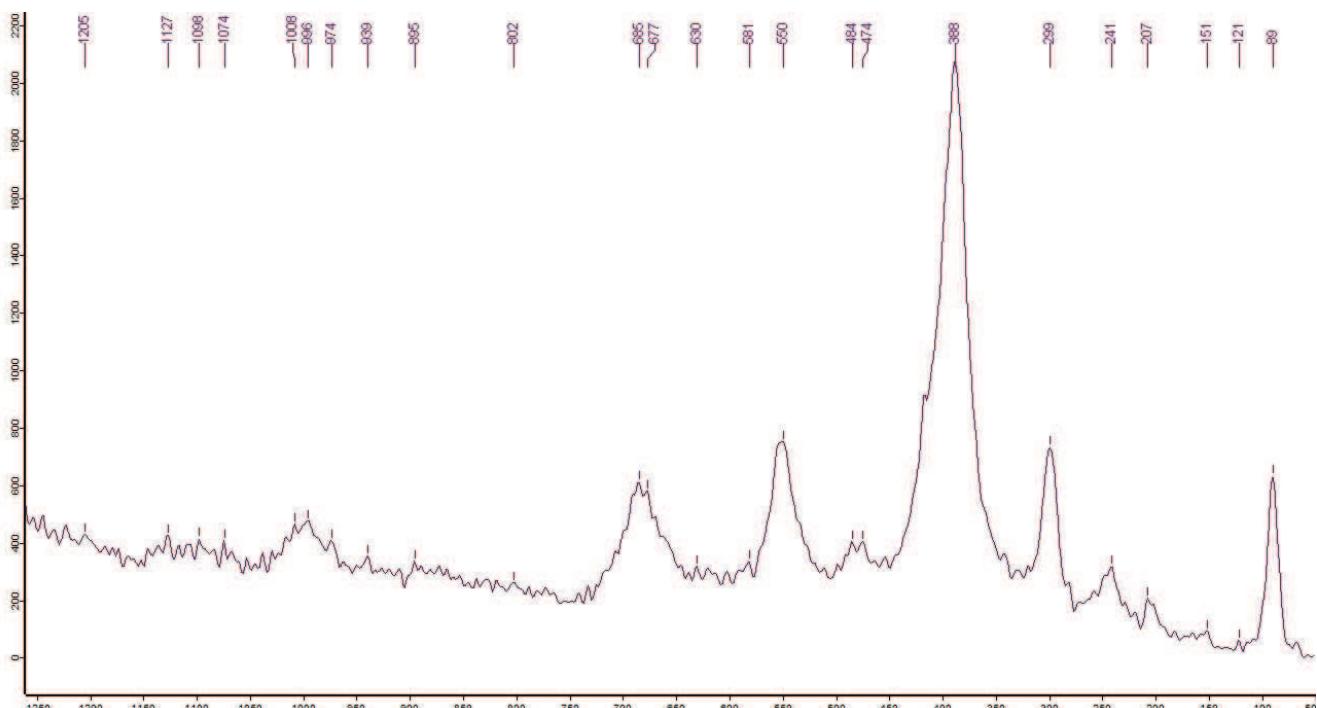

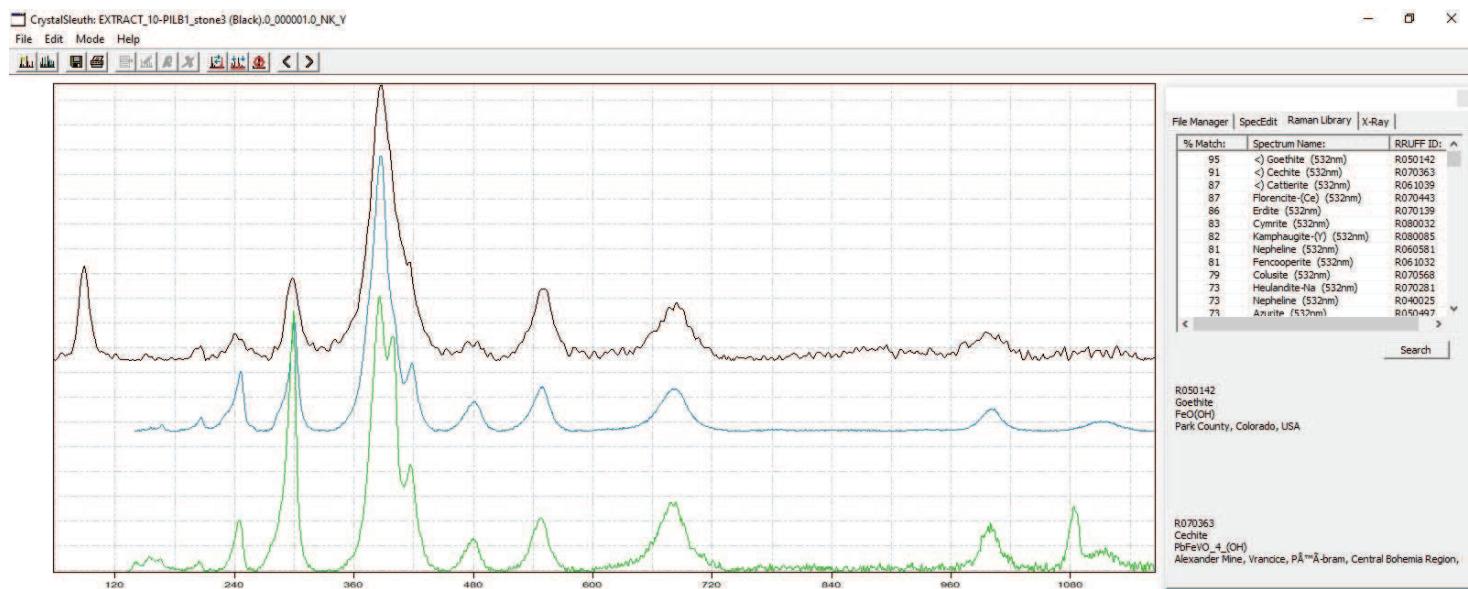

Sample :

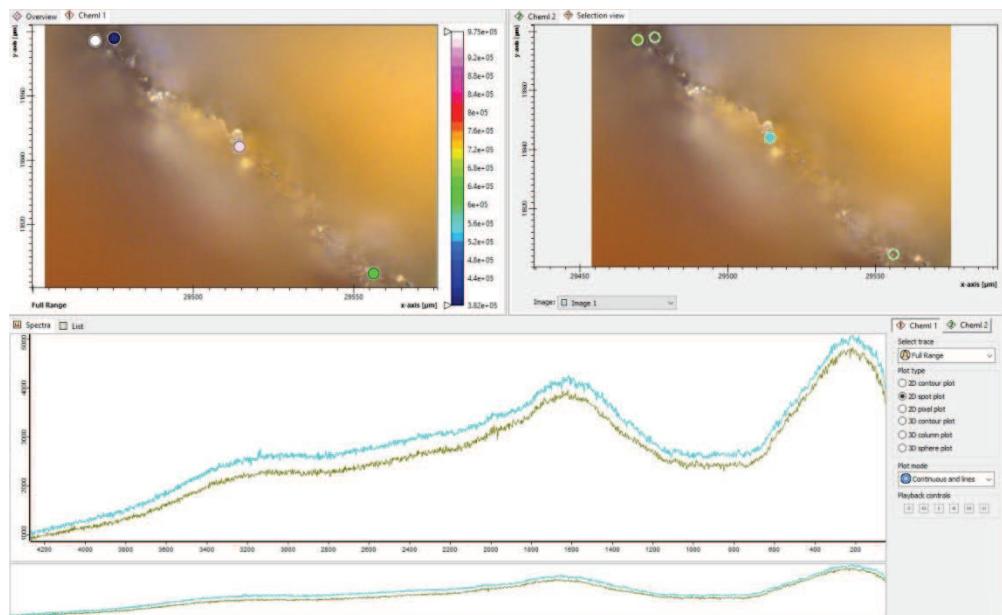

Sample Site 10 : Stone 3\_spectra 1 ( dark mineral ) indicates : Goethite , Chechite (→ see RRUFF\_CS )

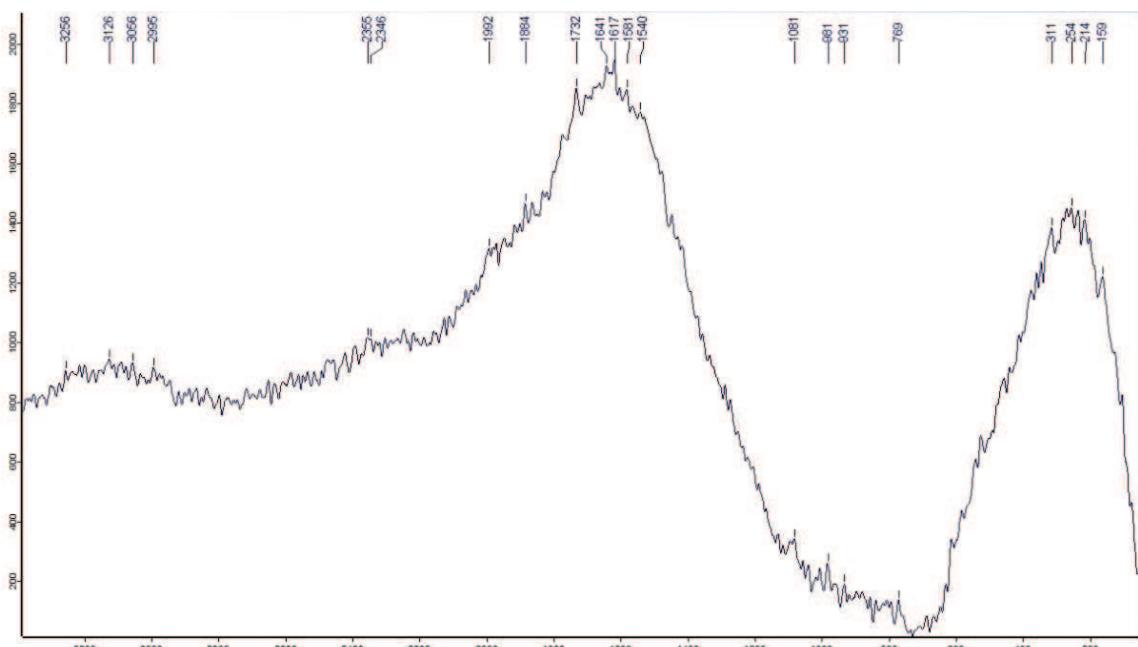

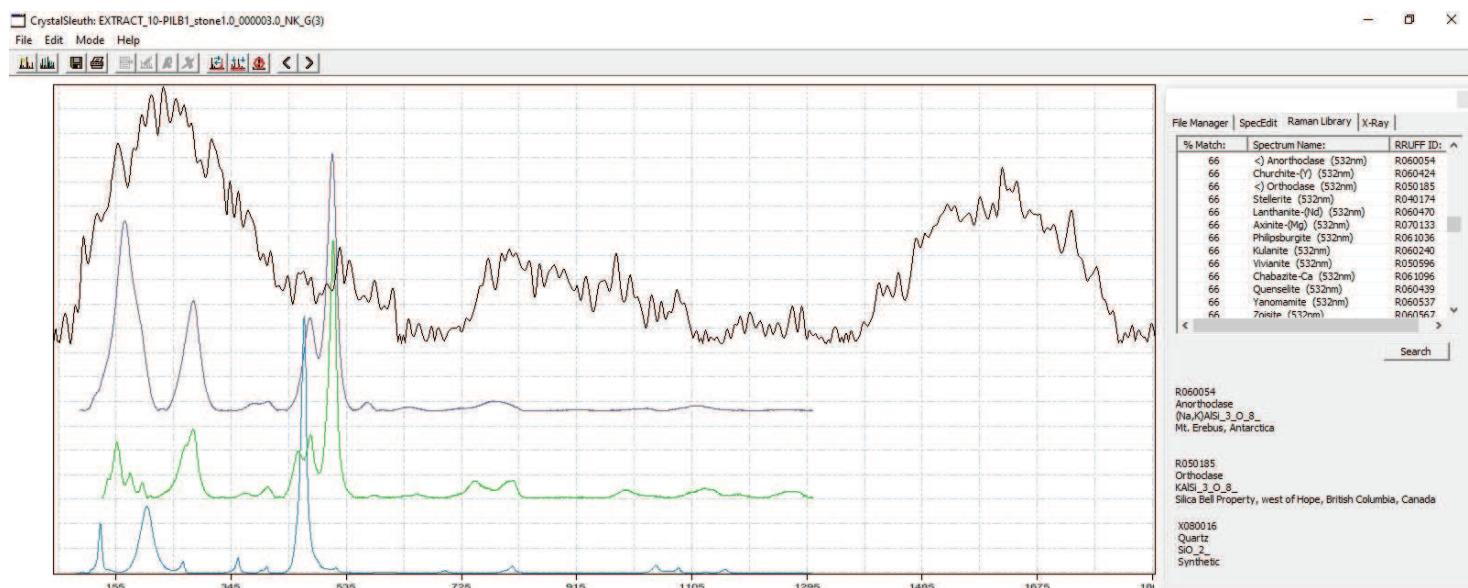

Sample :

**Sample Site 10 : Stone 1\_spectra 1 indicates : (Anorthoclase, Orthoclase (Quartz) ?? (→ see RRUFF\_CS results)**  
 Spectra contains too less information ! No proper analysis possible.

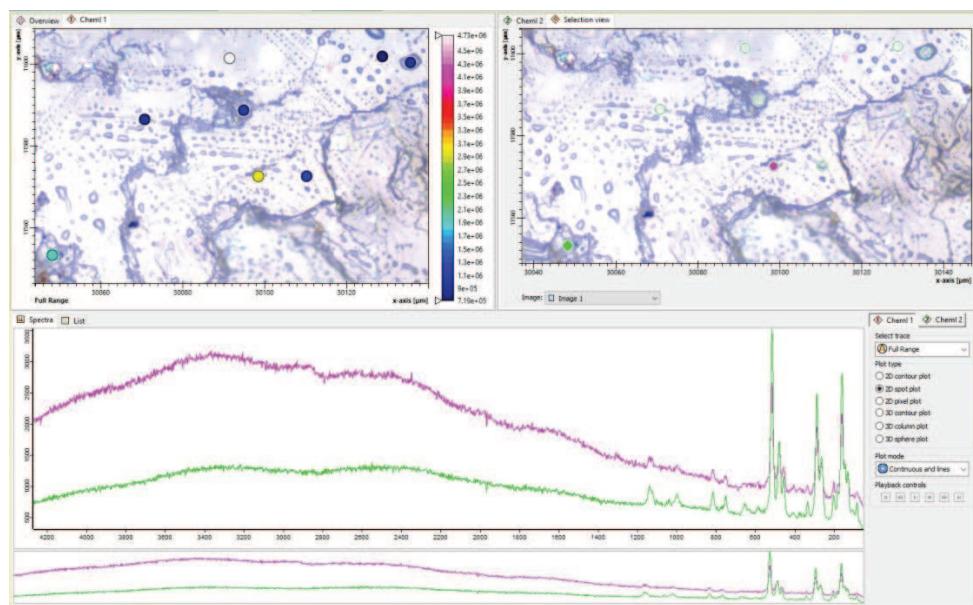

**Sample :**

## Sample Site 25 : Stone 3\_spectra 1 indicates : Microcline , Orthoclase

(→ see RRUFF\_CS results )

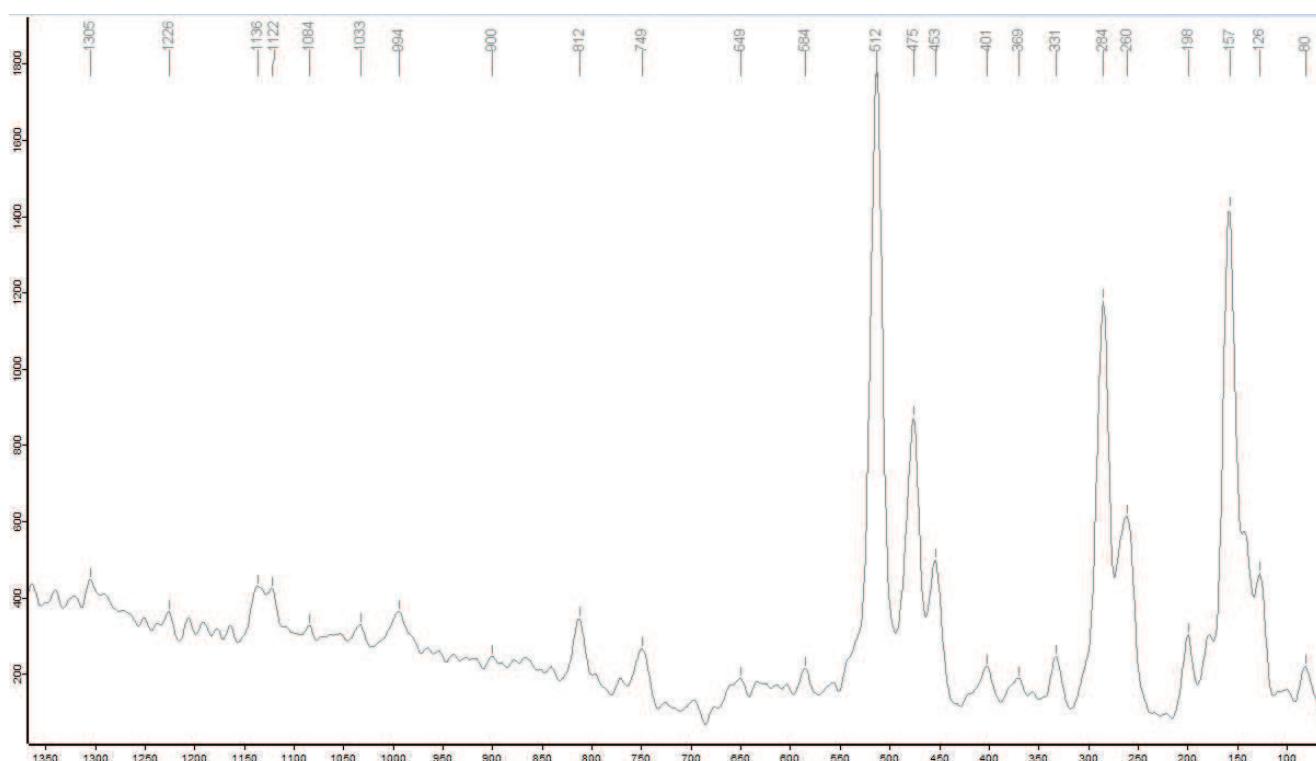

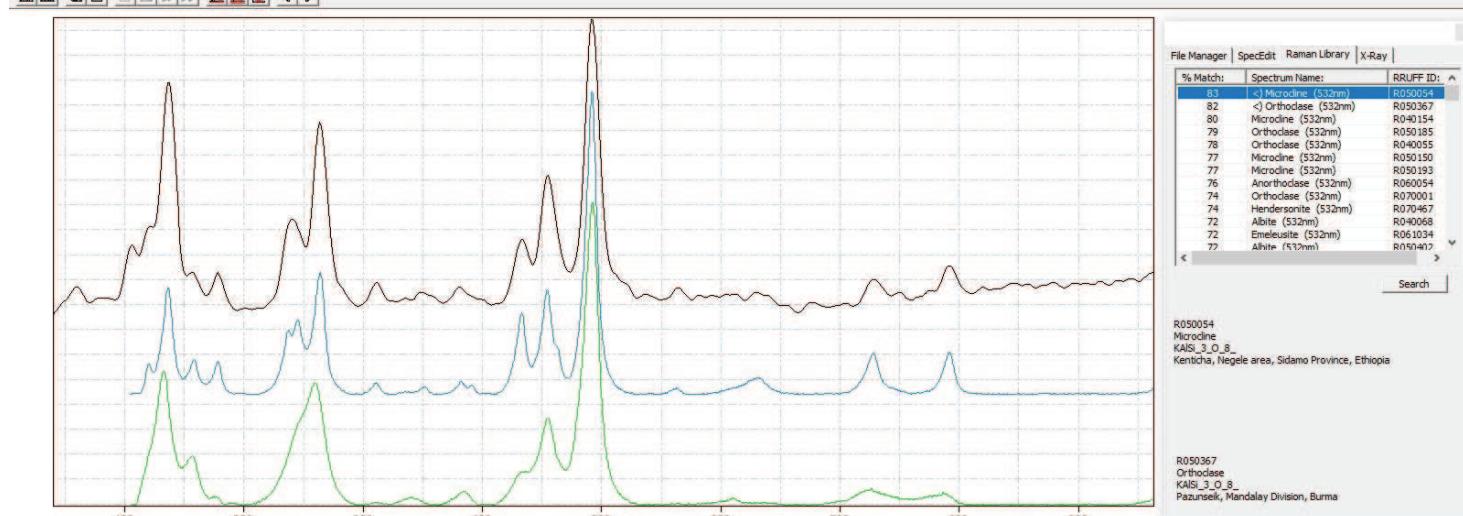

CrystalSleuth: EXTRACT\_25-PILB1\_stone3.0\_000000.0\_NK\_G1

File Edit Mode Help

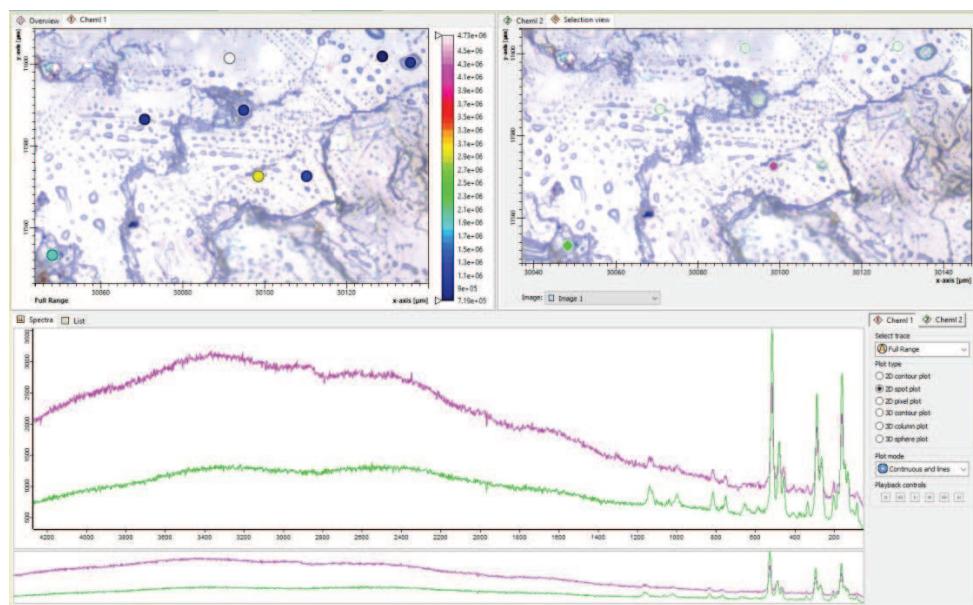

Sample :

# Sample Site 25 : Stone 3\_spectra 3 indicates : Microcline

(→ see RRUFF\_CS results )

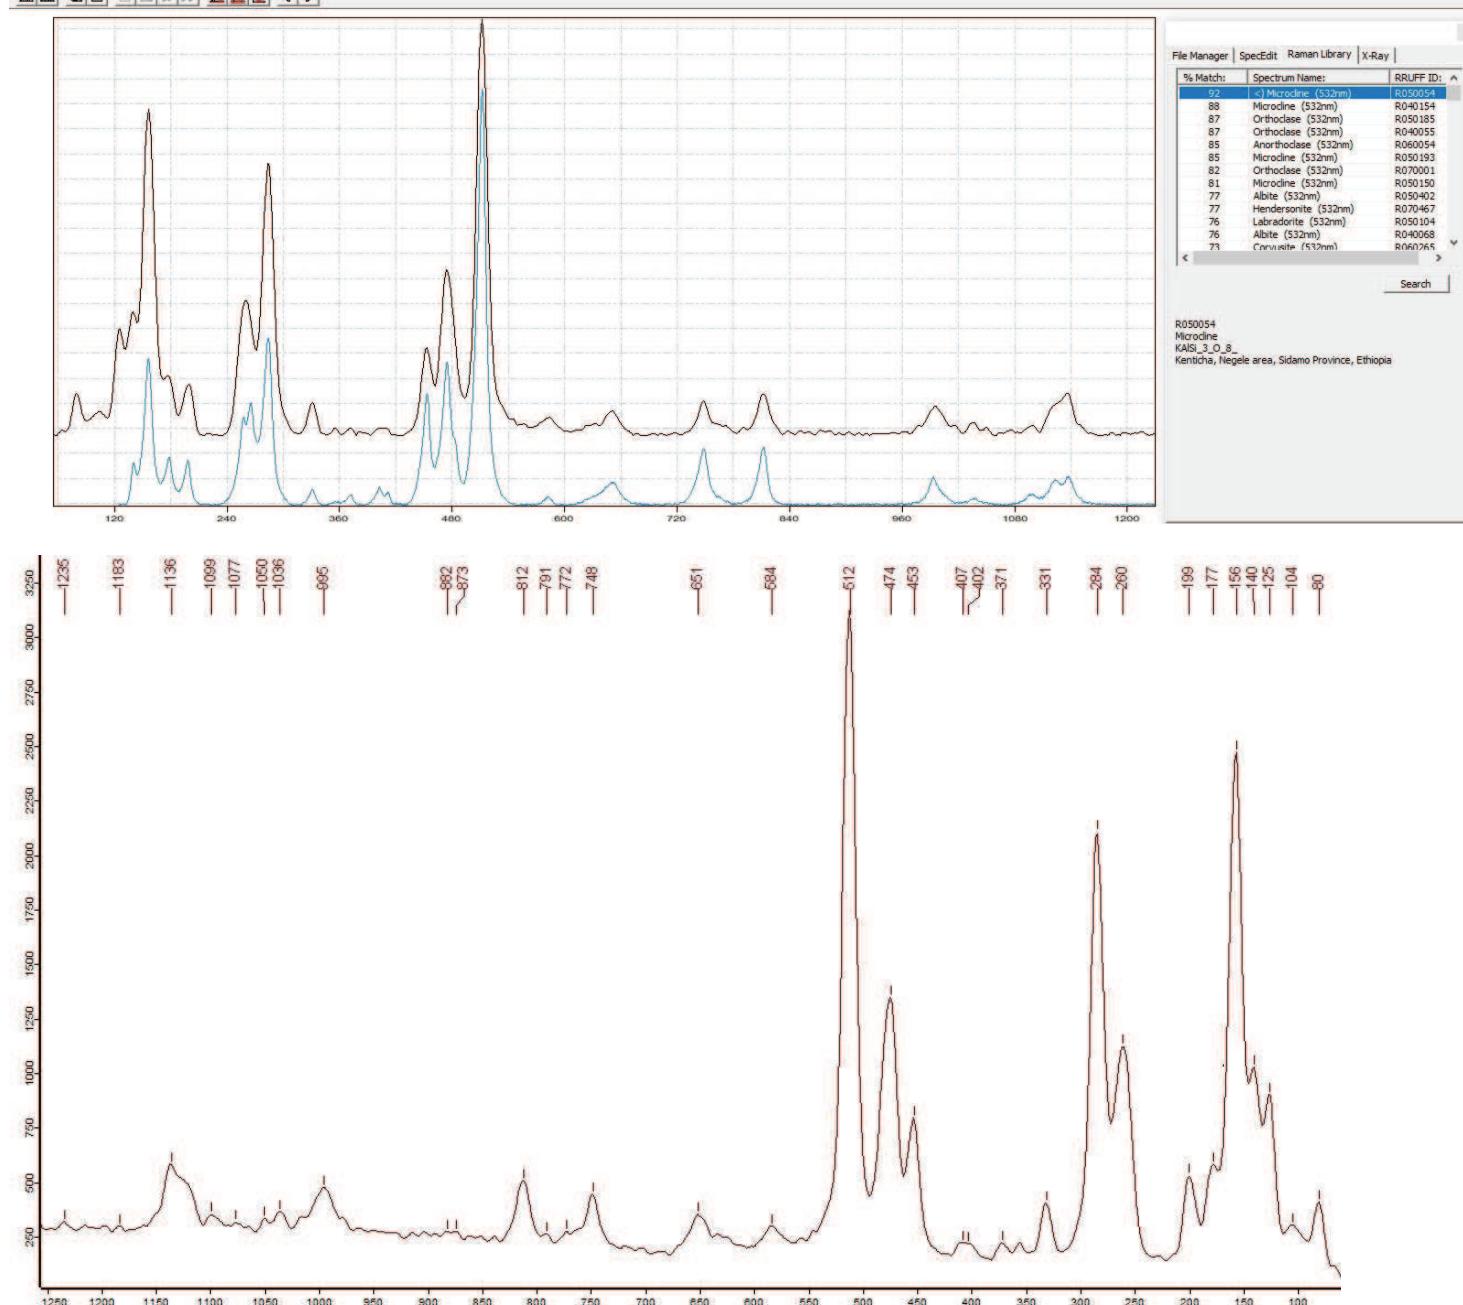

Sample :

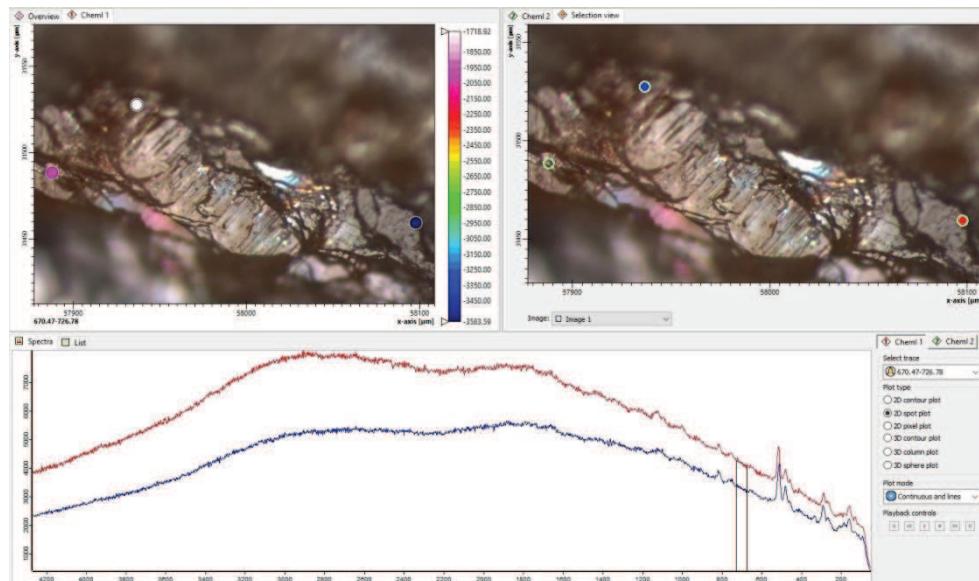

CrystalSleuth: EXTRACT\_25-PILB1\_stone3.0\_000007\_1\_NK\_G1

File Edit Mode Help

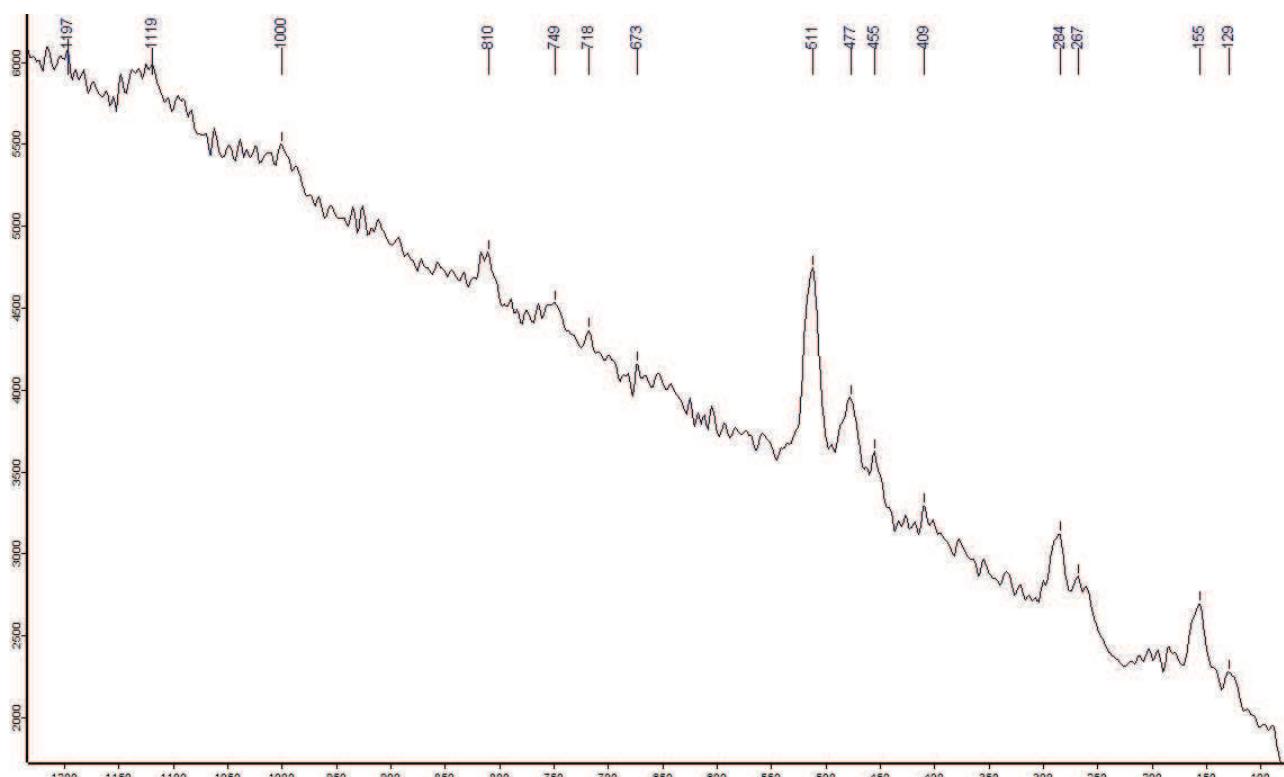

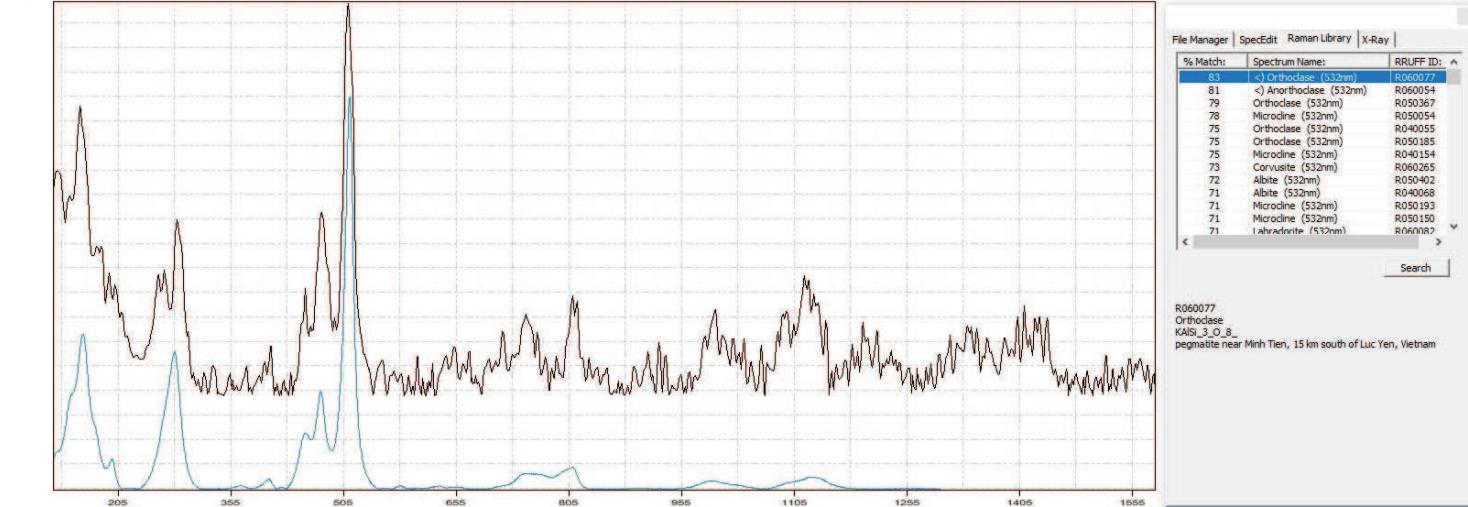

## Sample Site 25 : Stone 3\_spectra 4 indicates : Microcline, Orthoclase

(→ see RRUFF\_CS results )

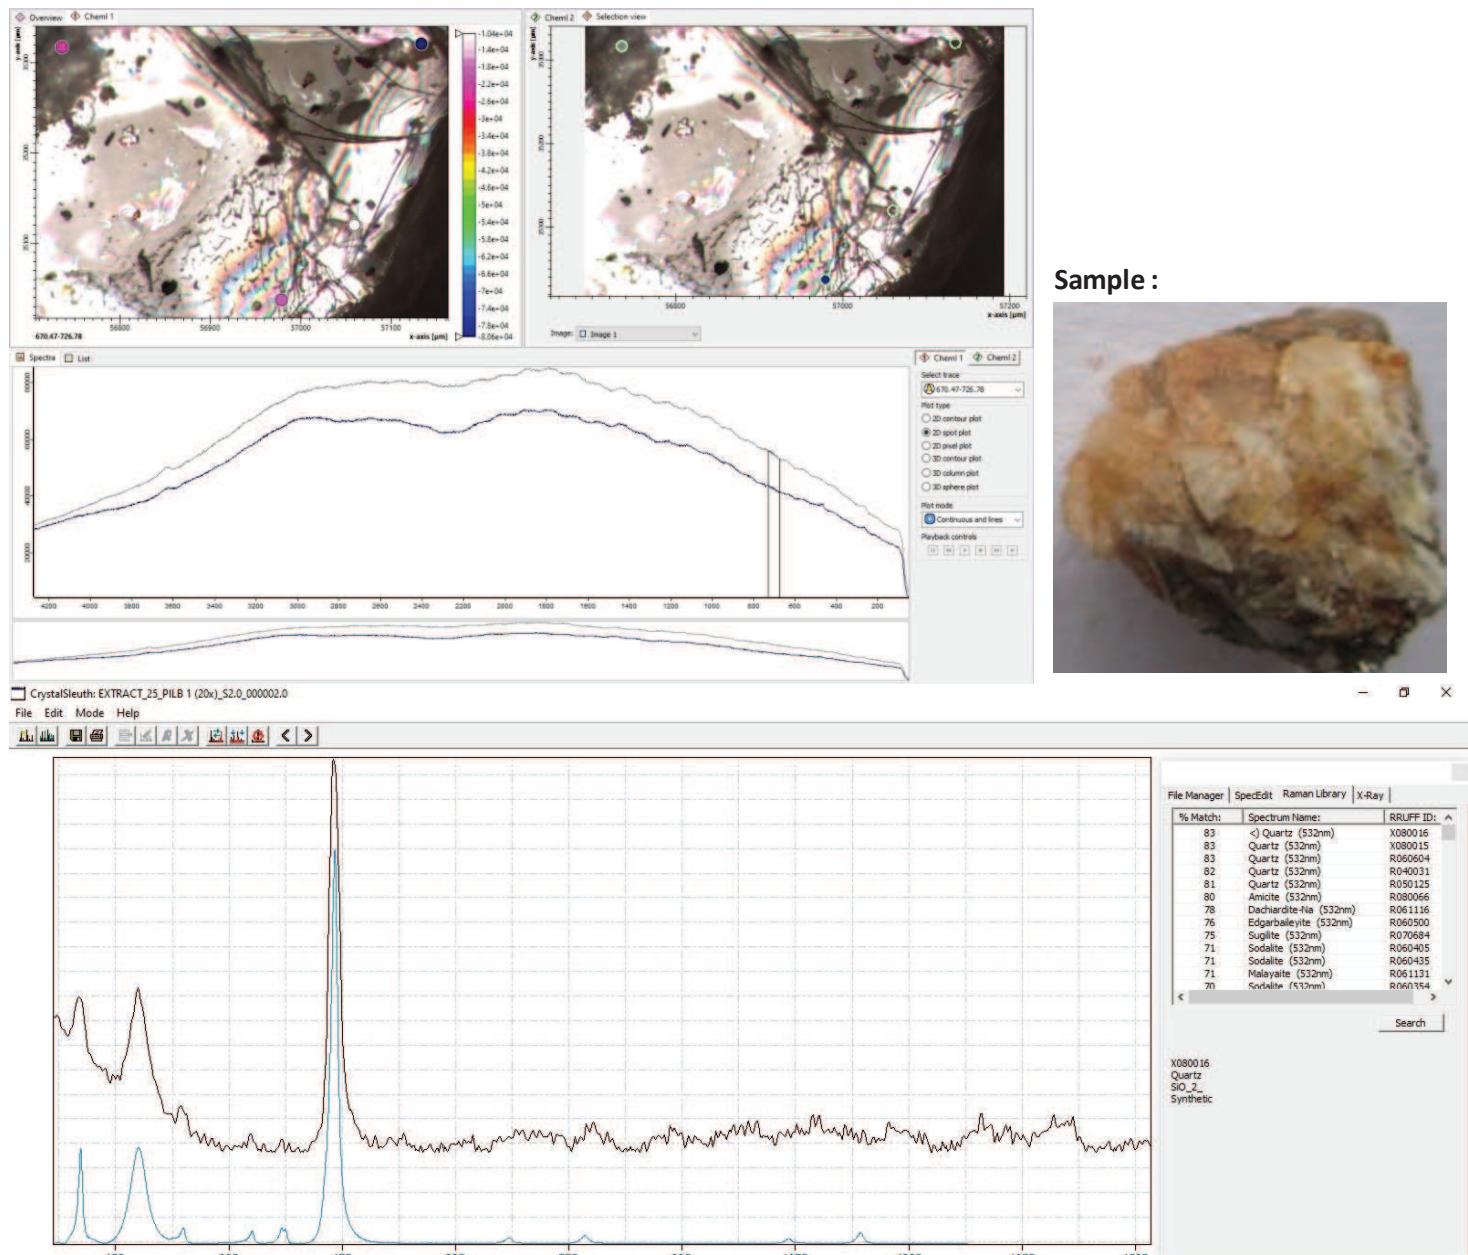

Possible PDFs (Planar Deformation Features) in the sample !

Sample :

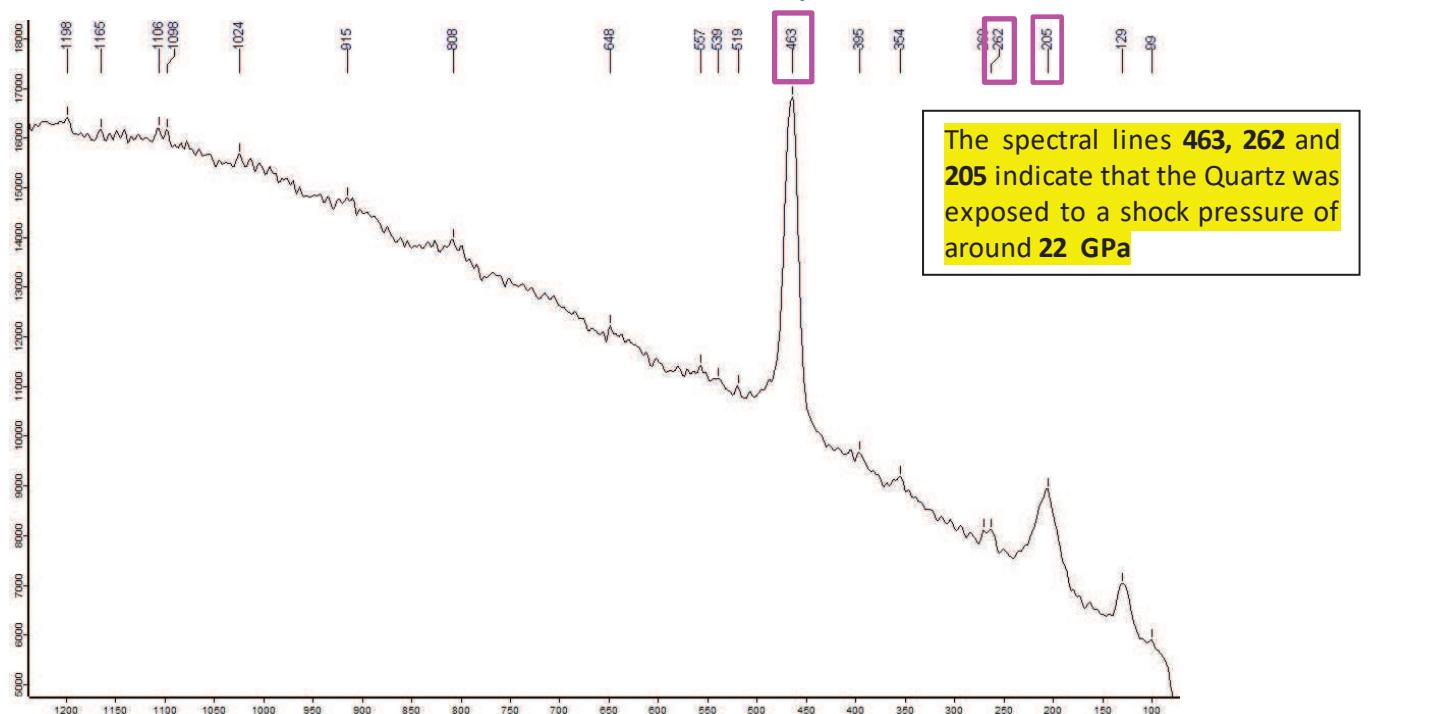

## Sample-Site 25 : Stone 2\_spectra 3 indicates: Quartz (→ see RRUFF\_CS results )

Sample :

Indication for a shock event are the shifts of the marked Quartz spectral lines towards 463, 262 and 205

## Appendix 1 : Photos of the rock samples from sample sites : 25, 10, 11 and 12-B

Please note : Photos of the Samples Sites [25](#), [10](#), [11](#) and 12-B and other sample sites are available on my website. → weblink : [Sample Sites Pilbara Crater 1](#)

**25**

**Note :** Site 25 is accessible over an unsealed road. But it is located on a mine-site. Permission may be required !

**Photos of the Samples Sites ( alternative links )**

[25](#), [10](#), [11](#) and other sites on :

[Sample Sites Pilbara Crater 1](#)

**10**

11

11 | 20° 21.904 S | 119° 27.818 E | 10 m | Pilbara 1

**Note :** The Sites 10, 11, 12 and 25 are accessible over unsealed roads But they are located on mine-sites ! Permission may be required to do an expedition !

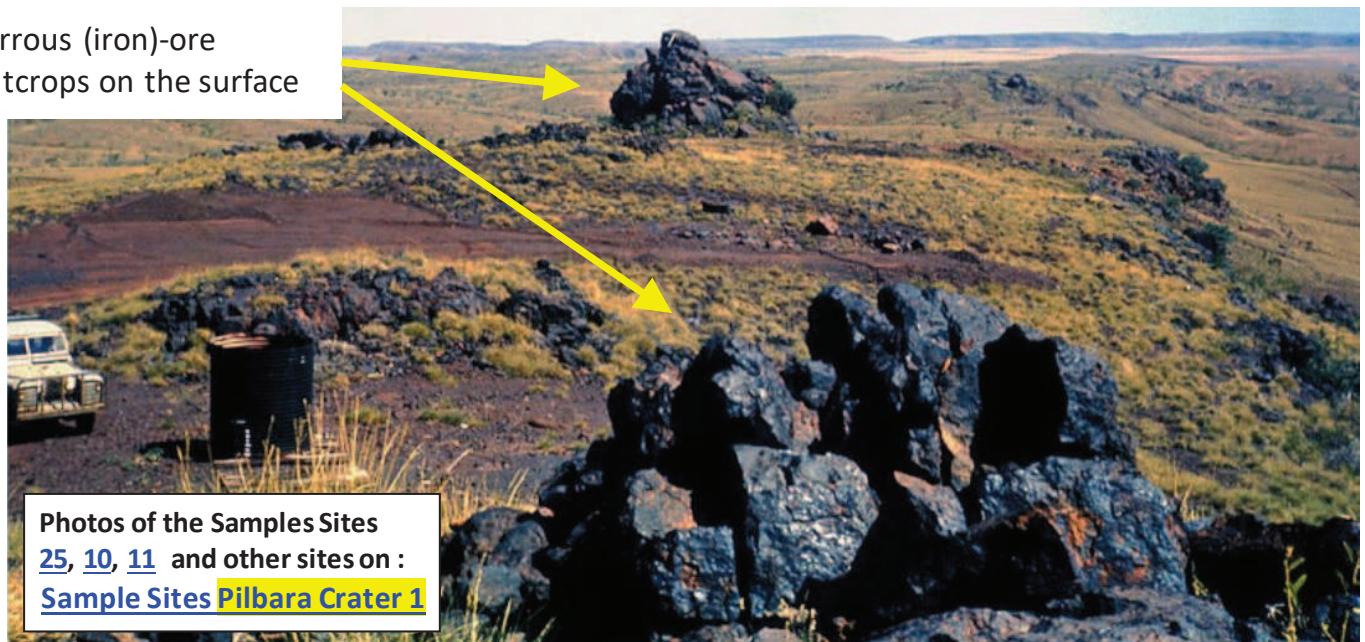

12-B

12-B | 20° 20.830 S | 119° 32.175 E | 10 m | Pilbara 1

Area of the samples sites 10,11 & 12-B : Image of the secondary impact site as it was in the 1960's Mt Goldsworthy had the world's richest deposits of ferrous ore. They were graded as high as 68 % !

Ferrous (iron)-ore outcrops on the surface

## Appendix 2 : A short overview : The Raman bands ( peaks ) of Quartz shocked with 22-26 GPa

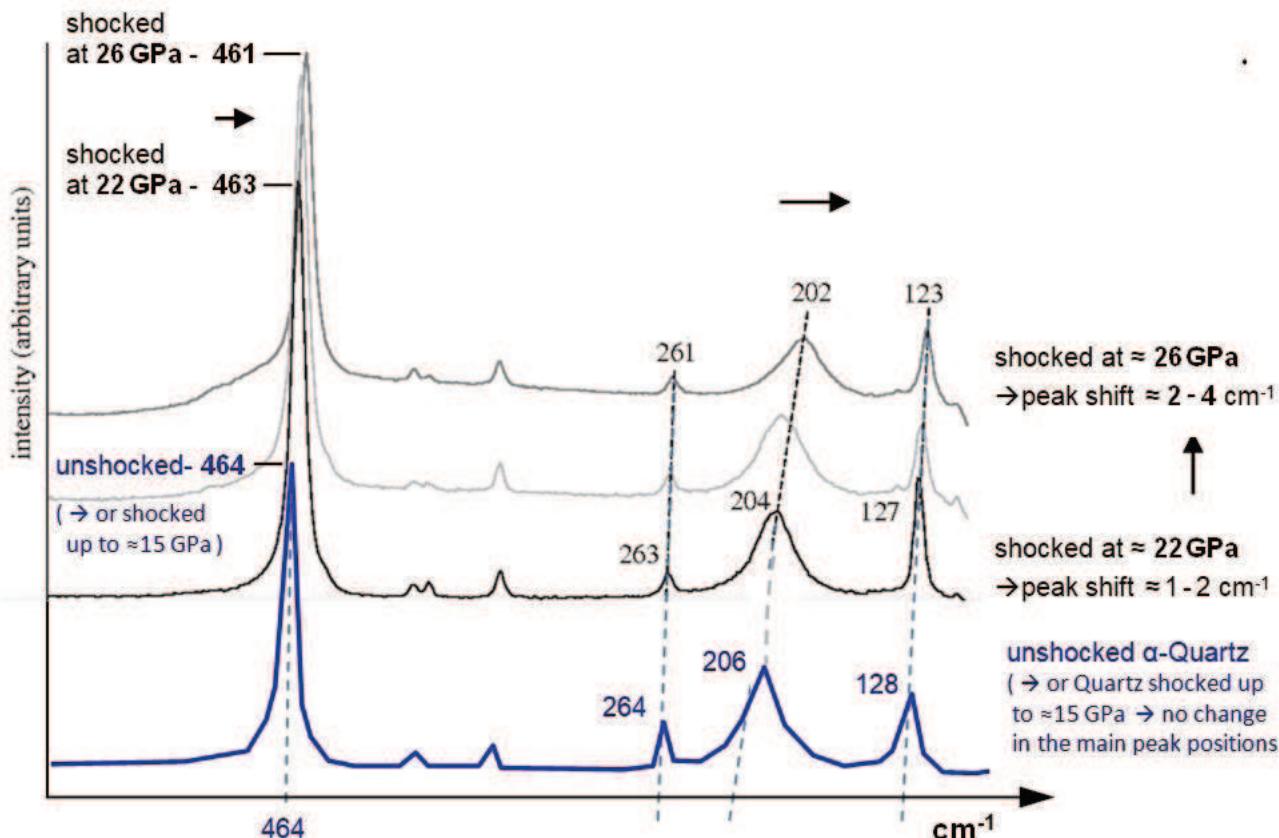

In order to verify a sample site as an impact site or impact structure, shock-metamorphic effects must be discovered in the rocks of the sample site. This can be done by different methods.

For example with the help of PDFs ( planar deformation features ) which are visible in the quartz with the help of a microscope. However this requires careful preparation of the samples and expertise.

Another, easier method, is the use of a RAMAN microscope. Micro-RAMAN Spectroscopy on quartz grains in the samples can provide the first evidence for a shock event, that was caused by an impact.

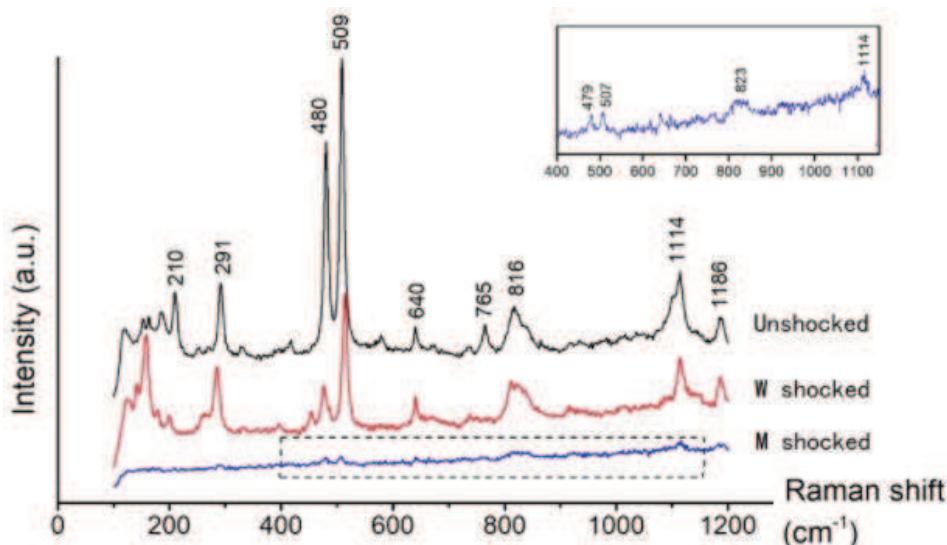

Mc Millan et al. (1992) and others have shown that the main RAMAN-peaks of Quartz shift towards lower frequencies if the Quartz was exposed to a shock-pressure > 15 GPa. → see diagram below

The shift of the main quartz RAMAN-peaks can be used to identify quartz that was shocked by an impact

Quartz shocked with **22 GPa** and **26 GPa** shows shifts of the main RAMAN-peaks of  $1 - 4 \text{ cm}^{-1}$  to lower frequencies

## Appendix 3 : Raman spectra of (W) weakly-shocked & (M) moderately-shocked Alkali-Feldspar

Weakly shocked alkali feldspar mainly developed irregular fractures and undulatory extinction. Note that the Raman-lines 210 and 765 are missing in the w-shocked feldspar, and an additional line at  $\approx 150$  appears.

The shock pressure for the w-shocked feldspar was estimated to be between 5 and 14 GPa
