# Sum of Three Cubes Explored <br> Proof 

Updated: September 21, 2023
Author: James DeCoste
jbdecoste@eastlink.ca

#### Abstract

Using already known techniques along with some not so obvious innovations on my part, I was able to show (prove) that there are solutions for all $K$ (except those of the form $9 \mathrm{~m}+/-4$ and $9 \mathrm{~m}+/-5$ which are impossible) for $+/-\mathrm{K}=+/-\left(\mathrm{x}^{\wedge} 3\right)+/-\left(\mathrm{y}^{\wedge} 3\right)+/-\left(\mathrm{z}^{\wedge} 3\right)$. A further stipulation is that $\mathrm{x}, \mathrm{y}$ and z must be whole numbers that can be a combination of positives and negatives. This is achieved through simple subtraction.

Setting up a table showing that all K can be represented using a multiple of 27 plus a mask lends validity to a portion of the proof. These representations may and often do contain many more than the required number of cubes summed up. I side step that problem by showing that no matter the K picked and how ever many cubes are required to create it in my representions, they can all be reduced to a maximum of cubes summed. Exactly what we require for the proof. Having done that we are complete. The three new cubes we have just reduced to are already included in table. They are items I have already represented in the above format.

I hope you enjoy this 'proof'.

## Introduction

This is a rather simple concept to grasp. For all $+/-\mathrm{K}$ there is at least one corresponding combination of 3 cubes summed. That is, there exists $K=+/-\left(x^{\wedge} 3\right)+/-\left(y^{\wedge} 3\right)+/-\left(z^{\wedge} 3\right) ;-K=+/-\left(x^{\wedge} 3\right)+/-\left(y^{\wedge} 3\right)+/-\left(z^{\wedge} 3\right)$. This is true for all $K$ except for those of the form $9 m+4 ; 9 m+5 ; 9 m-4$ and $9 m-5$. No solutions are possible for those, so they are excluded from this proof.

I will include some of Euclid's research adding in the negative components so that the proof is more inclusive. I will introduce a method of representing the remaining $K$ 's as a sum of cubes ( not limited to 3 max) created using multiples of 27 plus unique masks. This conforms to a very neat structure that can be used to formulate the proof.

From those representations, I will introduce how to reduce that many ( more than 3 cubes ) down to a 3 cube maximum. This is required for the proof. I show that all $+/-\mathrm{K}$ are reducable in this way.

Since we can relatively easily reduce to 3 cubes; we know that those cubes are already available. When we were building the structure with the multiples of 27 and the masks, it included those as well. There are already implied representations of them if we extent out our tables accordingly.

I look forward to any feedback that may help improve upon this 'proof '.

## Relationship of Perfect Cubes

Here is a partial list of the positive and negative perfect cubes:

| Base | +ve Base Cubed | -ve Base Cubed |
| ---: | ---: | ---: |
| 0 | 0 | 0 |
| 1 | 1 | -1 |
| 2 | 8 | -8 |
| 3 | 27 | -27 |
| 4 | 64 | -64 |
| 5 | 125 | -125 |
| 6 | 216 | -216 |
| 7 | 343 | -343 |
| 8 | 512 | -512 |
| 9 | 729 | -729 |
| 10 | 1000 | -1000 |
| 11 | 1331 | -1331 |
| 12 | 1728 | -1728 |
| 13 | 2197 | -2197 |
| 14 | 2744 | -2744 |
| 15 | 3375 | -3375 |
| 16 | 4096 | -4096 |
| 17 | 4913 | -4913 |
| 18 | 5832 | -5832 |
| 19 | 6859 | -6859 |
| 20 | 8000 | -8000 |

If you extend the base to include ALL whole numbers you will get the following partial chart:

| Base | Base Cubed | Absolute Difference | Separation by | Absolute Difference | Divisible by 6 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Multiples of 6 |  |  |
| -20 | -8000 |  | in Both Directions |  |  |
| -19 | -6859 | 1141 |  |  |  |
| -18 | -5832 | 1027 |  | 114 | 19 |
| -17 | -4913 | 919 |  | 108 | 18 |
| -16 | -4096 | 817 |  | 102 | 17 |
| -15 | -3375 | 721 |  | 96 | 16 |
| -14 | -2744 | 631 |  | 90 | 15 |
| -13 | -2197 | 547 |  | 84 | 14 |
| -12 | -1728 | 469 |  | 78 | 13 |
| -11 | -1331 | 397 |  | 72 | 12 |
| -10 | -1000 | 331 |  | 66 | 11 |
| -9 | -729 | 271 |  | 60 | 10 |
| -8 | -512 | 217 |  | 54 | 9 |
| -7 | -343 | 169 |  | 48 | 8 |
| -6 | -216 | 127 |  | 42 | 7 |
| -5 | -125 | 91 |  | 36 | 6 |
| -4 | -64 | 61 | 61=37+24 | 30 | 5 |
| -3 | -27 | 37 | 37=19+18 | 24 | 4 |
| -2 | -8 | 19 | 19=7+12 | 18 | 3 |
| -1 | -1 | 7 | $7=1+6$ | 12 | 2 |
| 0 | 0 |  | $1=1+0$ | 6 | 1 |
| 1 | 1 | 1 | 1=1+0 | 0 | 0 |
| 2 | 8 | 7 | $7=1+6$ | 6 | 1 |
| 3 | 27 | 19 | $19=7+12$ | 12 | 2 |
| 4 | 64 | 37 | 37=19+18 | 18 | 3 |
| 5 | 125 | 61 | 61=37+24 | 24 | 4 |
| 6 | 216 | 91 |  | 30 | 5 |
| 7 | 343 | 127 |  | 36 | 6 |
| 8 | 512 | 169 |  | 42 | 7 |
| 9 | 729 | 217 |  | 48 | 8 |
| 10 | 1000 | 271 |  | 54 | 9 |
| 11 | 1331 | 331 |  | 60 | 10 |
| 12 | 1728 | 397 |  | 66 | 11 |
| 13 | 2197 | 469 |  | 72 | 12 |
| 14 | 2744 | 547 |  | 78 | 13 |
| 15 | 3375 | 631 |  | 84 | 14 |
| 16 | 4096 | 721 |  | 90 | 15 |
| 17 | 4913 | 817 |  | 96 | 16 |
| 18 | 5832 | 919 |  | 102 | 17 |
| 19 | 6859 | 1027 |  | 108 | 18 |
| 20 | 8000 | 1141 |  | 114 | 19 |

I may not be able to use this fact directly in any proof, but it does show that there is a pattern to the growth from one cube to the next in line, which is related to a multiple of ' 6 ' and an addition of a multiple of 6 . Now that is interesting because $\mathrm{X} 1=\mathrm{X} 0+\left(6^{*} \mathrm{y}\right)$ in the two possible directions, right? That set of Xn 's can be further defined as XX1 $=\mathrm{XX} 0+\left(6^{*} \mathrm{y}\right)$ in both directions. That's a neat and consistant pattern that predicts what the next cube will be.

This is a good spot to point out that the third column shows the abosolute difference between the adjacent cubes... $1,7,19,37, \ldots$ These will aid in the search of 3 cubes that add up to exactly K. The cubes themselves get us started. For example $K=0$ can be found by adding 3 cubes of ' 0 ' or $0^{\wedge} 3+x^{\wedge} 3+(-x)^{\wedge} 3$. $K=1$ can be found by adding a single cude of 1 to any pair of $+/$-cubes... $1=1^{\wedge} 3+5^{\wedge} 3+(-5)^{\wedge} 3$. $K=2$ can be 2 cubes of ' 1 ' plus $0 \wedge 3$. $K=3 \ldots 3$ cubes of 1 . Note that we will be skipping over any $9 m+4$ and $9 m+5$ since they are impossible...these include $4,5,13,14,22,23,31,32, \ldots$ So our next candidate is $K=6$ which we can easily get with a difference from column 3 , like ' 7 ' and ' -1 '. ' 7 ' is a combination of ' 8 ' and ' -1 '... so ultimately ' 8 ', ' -1 ' and '-
$1^{\prime}$ '. K=7 like above can be ' 7 ' and ' 0 '...' 8 ', ' -1 ' and ' 0 ' or simply ' 8 ', ' -1 ' and ' 0 ' since we don't need the intermediate ' 7 '. $\mathrm{K}=8$ is simply ' 8 ', and two ' 0 '.

## Euclid's Division Lemma (Extended to Include Negative Whole Numbers)

I'm not going to re-invent the wheel so I will briefly describe this lemma and how it becomes useful to our search for a proof.

In summary Euclid was able to prove that any cubed positive whole number can be represented in one of three forms: $9 \mathrm{~m}+0 ; 9 \mathrm{~m}+1$ or $9 \mathrm{~m}+8$. I totally agree with this lemma. Now that lemma can be extended to include all whole numbers whether they be positive of negative. We need only make two simple changes in the 9 m subsets: $9 \mathrm{~m}-1$ or $9 \mathrm{~m}-8$. These are directional changes only! See the following chart:

| a | a cubed | Euclid's | -a cubed | Euclid's Extended |
| :---: | ---: | :---: | ---: | :---: |
| 0 | 0 | $9 m$ | 0 | $9 m$ |
| 1 | 1 | $9 m+1$ | -1 | $9 m-1$ |
| 2 | 8 | $9 m+8$ | -8 | $9 m-8$ |
| 3 | 27 | $9 m$ | -27 | $9 m$ |
| 4 | 64 | $9 m+1$ | -64 | $9 m-1$ |
| 5 | 125 | $9 m+8$ | -125 | $9 m-8$ |
| 6 | 216 | $9 m$ | -216 | $9 m$ |
| 7 | 343 | $9 m+1$ | -343 | $9 m-1$ |
| 8 | 512 | $9 m+8$ | -512 | $9 m-8$ |
| 9 | 729 | $9 m$ | -729 | $9 m$ |
| 10 | 1000 | $9 m+1$ | -1000 | $9 m-1$ |
| 11 | 1331 | $9 m+8$ | -1331 | $9 m-8$ |
| 12 | 1728 | $9 m$ | -1728 | $9 m$ |
| 13 | 2197 | $9 m+1$ | -2197 | $9 m-1$ |
| 14 | 2744 | $9 m+8$ | -2744 | $9 m-8$ |
| 15 | 3375 | $9 m$ | -3375 | $9 m$ |
| 16 | 4096 | $9 m+1$ | -4096 | $9 m-1$ |
| 17 | 4913 | $9 m+8$ | -4913 | $9 m-8$ |
| 18 | 5832 | $9 m$ | -5832 | $9 m$ |
| 19 | 6859 | $9 m+1$ | -6859 | $9 m-1$ |
| 20 | 8000 | $9 m+8$ | -8000 | $9 m-8$ |
| 21 | 9261 | $9 m$ | -9261 | $9 m$ |
| 22 | 10648 | $9 m+1$ | -10648 | $9 m-1$ |
| 23 | 12167 | $9 m+8$ | -12167 | $9 m-8$ |
| 24 | 13824 | $9 m$ | -13824 | $9 m$ |
| 25 | 15625 | $9 m+1$ | -15625 | $9 m-1$ |
| 26 | 17576 | $9 m+8$ | -17576 | $9 m-8$ |
| 27 | 19683 | $9 m$ | -19683 | $9 m$ |
| 28 | 21952 | $9 m+1$ | -21952 | $9 m-1$ |
| 29 | 24389 | $9 m+8$ | -24389 | $9 m-8$ |
|  |  |  |  |  |
|  | $9 m$ | $9 m$ | $9 m$ | $9 m$ |
| 1 | $9 m$ | $9 m$ | $9 m$ | $9 m$ |

As can be readily seen, if a cubed number results in a multiple of 3, there is no need to add a directional component. So 9 m will suffice; the direction is built in. Needless to say, the other two which have directional components of +1 and +8 must be changed to -1 and -8 ( opposite direction ) to match the cubed number exactly. When looking at the negative cubes remember that $9 \mathrm{~m}-\mathrm{x}$ only works if you make m negative; (9)(-7)-1. Right? I'm making every effort to keep this easily understandable. So expanding on Euclid's work I have 17 9 m 's to work with to cover the entire number set $K$. They include $9 \mathrm{~m}, 9 \mathrm{~m}+1,9 \mathrm{~m}-1,9 \mathrm{~m}+2,9 \mathrm{~m}-2,9 \mathrm{~m}+3,9 \mathrm{~m}-3$, $9 m+4,9 m-4,9 m+5,9 m-5,9 m+6,9 m-6,9 m+7,9 m-7,9 m+8$ and $9 m-8$. Note that $9 m$ works for both positive and negative...which leads me to quickly conclude that there should be twice as many 9 m as any of the others. This will play into some 'density' considerations further on in our discussion.

I have not done any serious investigation into Euclid's work but he likely talks about my next topic which is this subset of 9 m 's. It becomes obvious after taking a quick look at all positive whole numbers that they can be sub-divided into 9 groups of 9 m 's: $9 \mathrm{~m} ; 9 \mathrm{~m}+1 ; 9 \mathrm{~m}+2 ; 9 \mathrm{~m}+3 ; 9 \mathrm{~m}+4 ; 9 \mathrm{~m}+5 ; 9 \mathrm{~m}+6 ; 9 \mathrm{~m}+7$; and $9 \mathrm{~m}+8$. See the following chart:

| 9m | $9 \mathrm{~m}+1$ | $9 \mathrm{~m}+2$ | $9 \mathrm{~m}+3$ | $9 \mathrm{~m}+4$ | $9 \mathrm{~m}+5$ | $9 \mathrm{~m}+6$ | $9 \mathrm{~m}+7$ | $9 \mathrm{~m}+8$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 |
| 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 |
| 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 |
| 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | 44 |
| 45 | 46 | 47 | 48 | 49 | 50 | 51 | 52 | 53 |
| 54 | 55 | 56 | 57 | 58 | 59 | 60 | 61 | 62 |
| 63 | 64 | 65 | 66 | 67 | 68 | 69 | 70 | 71 |
| 72 | 73 | 74 | 75 | 76 | 77 | 78 | 79 | 80 |
| 81 | 82 | 83 | 84 | 85 | 86 | 87 | 88 | 89 |
| 90 | 91 | 92 | 93 | 94 | 95 | 96 | 97 | 98 |
| 99 | 100 | 101 | 102 | 103 | 104 | 105 | 106 | 107 |
| 108 | 109 | 110 | 111 | 112 | 113 | 114 | 115 | 116 |
| 117 | 118 | 119 | 120 | 121 | 122 | 123 | 124 | 125 |
| 126 | 127 | 128 | 129 | 130 | 131 | 132 | 133 | 134 |
| 135 | 136 | 137 | 138 | 139 | 140 | 141 | 142 | 143 |
| 144 | 145 | 146 | 147 | 148 | 149 | 150 | 151 | 152 |
| 153 | 154 | 155 | 156 | 157 | 158 | 159 | 160 | 161 |
| 162 | 163 | 164 | 165 | 166 | 167 | 168 | 169 | 170 |
| 171 | 172 | 173 | 174 | 175 | 176 | 177 | 178 | 179 |
| 180 | 181 | 182 | 183 | 184 | 185 | 186 | 187 | 188 |
| 189 | 190 | 191 | 192 | 193 | 194 | 195 | 196 | 197 |
| 198 | 199 | 200 | 201 | 202 | 203 | 204 | 205 | 206 |
| 207 | 208 | 209 | 210 | 211 | 212 | 213 | 214 | 215 |
| 216 | 217 | 218 | 219 | 220 | 221 | 222 | 223 | 224 |
| 225 | 226 | 227 | 228 | 229 | 230 | 231 | 232 | 233 |
| 234 | 235 | 236 | 237 | 238 | 239 | 240 | 241 | 242 |
| 243 | 244 | 245 | 246 | 247 | 248 | 249 | 250 | 251 |
| 252 | 253 | 254 | 255 | 256 | 257 | 258 | 259 | 260 |
| 261 | 262 | 263 | 264 | 265 | 266 | 267 | 268 | 269 |
| 270 | 271 | 272 | 273 | 274 | 275 | 276 | 277 | 278 |
| 279 | 280 | 281 | 282 | 283 | 284 | 285 | 286 | 287 |
| 288 | 289 | 290 | 291 | 292 | 293 | 294 | 295 | 296 |
| 297 | 298 | 299 | 300 | 301 | 302 | 303 | 304 | 305 |

There is a corresponding chart for the negative whole numbers. I kept that chart much smaller since it is for all intents and purpose a mirror directional image of the above chart.

| 9 m | $9 \mathrm{~m}-1$ | $9 \mathrm{~m}-2$ | $9 \mathrm{~m}-3$ | $9 \mathrm{~m}-4$ | $9 \mathrm{~m}-5$ | $9 \mathrm{~m}-6$ | $9 \mathrm{~m}-7$ | $9 \mathrm{~m}-8$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |
| 0 | -1 | -2 | -3 | -4 | -5 | -6 | -7 | -8 |
| -9 | -10 | -11 | -12 | -13 | -14 | -15 | -16 | -17 |
| -18 | -19 | -20 | -21 | -22 | -23 | -24 | -25 | -26 |
| -27 | -28 | -29 | -30 | -31 | -32 | -33 | -34 | -35 |
| -36 | -37 | -38 | -39 | -40 | -41 | -42 | -43 | -44 |
| -45 | -46 | -47 | -48 | -49 | -50 | -51 | -52 | -53 |
| -54 | -55 | -56 | -57 | -58 | -59 | -60 | -61 | -62 |
| -63 | -64 | -65 | -66 | -67 | -68 | -69 | -70 | -71 |
| -72 | -73 | -74 | -75 | -76 | -77 | -78 | -79 | -80 |
| -81 | -82 | -83 | -84 | -85 | -86 | -87 | -88 | -89 |
| -90 | -91 | -92 | -93 | -94 | -95 | -96 | -97 | -98 |
| -99 | -100 | -101 | -102 | -103 | -104 | -105 | -106 | -107 |

If one were to place the actual cubes of the whole numbers ( positive or negative ), one would find that they fall in the $9 \mathrm{~m} ; 9 \mathrm{~m}+1 ; 9 \mathrm{~m}+8 ; 9 \mathrm{~m}-1 ; 9 \mathrm{~m}-8$ columns. Right? I've highlighted them in yellow in both the above charts. Euclid has already proven this much, I just added the negative whole number components.

## 'Modulo 9' ( $9 \mathrm{~m}+/-4 ; 9 \mathrm{~m}+/-5$ are Impossible to Create with Sum of 3 Cubes )

As I've eluded to previously, the columns represented by $9 m+4,9 m+5,9 m-4$ and $9 m-5$ are impossible to create using the 'sum of 3 cubes'. Why you might ask? As I have discovered in the limited literature on this subject, the use of modulo 9 is the key. See the following chart:

| 9 m s | $1^{\text {st }} 18$ | Mod 9 |
| :--- | ---: | ---: |
|  |  |  |
| $9 m$ | 0 | 0 |
| $9 m+1$ | 1 | 1 |
| $9 m+2$ | 2 | 2 |
| $9 m+3$ | 3 | 3 |
| $9 m+4$ | 4 | 4 |
| $9 m+5$ | 5 | 5 |
| $9 m+6$ | 6 | 6 |
| $9 m+7$ | 7 | 7 |
| $9 m+8$ | 8 | 8 |
|  |  |  |
| $9 m$ | 0 | 0 |
| $9 m-1$ | -1 | 8 |
| $9 m-2$ | -2 | 7 |
| $9 m-3$ | -3 | 6 |
| $9 m-4$ | -4 | 5 |
| $9 m-5$ | -5 | 4 |
| $9 m-6$ | -6 | 3 |
| $9 m-7$ | -7 | 2 |
| $9 m-8$ | -8 | 1 |

As seen, Mod 9 on the positive whole numbers gives expected remainders. The negative whole numbers seems backwards but it is correct; for example $-8 \operatorname{Mod} 9$ is the same as saying $9-8 / 9$ which is 1 . Right? But do note that this does not affect what we are trying to show here. Note that above, the cubes only show up in 9 m , $9 m+1,9 m+8,9 m-1$ and $9 m-8$. For all intents and purpose $9 m-1$ is the same modulo result as $9 m+8$ and $9 m-8$ is
the same as $9 \mathrm{~m}+1$. Those two are reversed. The three Mod 9 answers remain the same for both postive and negative whole numbers with respect to cubes.

| Base | cubes | Mod 9 |
| ---: | ---: | ---: |
|  |  |  |
| 0 | 0 | 0 |
| 1 | 1 | 1 |
| 2 | 8 | 8 |
| 3 | 27 | 0 |
| 4 | 64 | 1 |
| 5 | 125 | 8 |
| 6 | 216 | 0 |
| 7 | 343 | 1 |
| 8 | 512 | 8 |
|  |  |  |
| 0 | 0 | 0 |
| -1 | -1 | 8 |
| -2 | -8 | 1 |
| -3 | -27 | 0 |
| -4 | -64 | 8 |
| -5 | -125 | 1 |
| -6 | -216 | 0 |
| -7 | -343 | 8 |
| -8 | -512 | 1 |

Now my understanding is that since the only possible Mod 9 entries for any cube is 0,1 or $8 \ldots$ we can create $0,1,2,3,6,7$, and 8 from these base cubes mod $9 \ldots$...but we can not for 4 and 5 . There is a second chart for the negative K's which complements (opposite direction) of the first. See the following two charts:

| $K$ | $K=a^{\wedge} 3+b^{\wedge} 3+c^{\wedge} 3$ |
| :---: | :---: |
|  | $0,1,-1,8$ or -8 |
| 0 | $0+0+0$ |
| 1 | $0+0+1$ |
| 2 | $0+1+1$ |
| 3 | $1+1+1$ |
| 4 | Impossible |
| 5 | Impossible |
| 6 | $8+(-1)+(-1)$ |
| 7 | $8+0+(-1)$ |
| 8 | $8+0+0$ |

| $K$ | $K=a^{\wedge} 3+b^{\wedge} 3+c^{\wedge} 3$ |
| :---: | :---: |
|  | $0,1,-1,8$ or -8 |
| 0 | $0+0+0$ |
| -1 | $0+0+(-1)$ |
| -2 | $0+(-1)+(-1)$ |
| -3 | $(-1)+(-1)+(-1)$ |
| -4 | Impossible |
| -5 | Impossible |
| -6 | $(-8)+1+1$ |
| -7 | $(-8)+0+1$ |
| -8 | $(-8)+0+0$ |

Note that the second column in the above charts can be formulated in different ways. So we are not limited to the easiest ones I have shown. For example 3 can be formed by adding $(-5)^{\wedge} 3 ; 4 \wedge 3$ and $4 \wedge 3 ;-125+$ $64+64=3$. Note that -125 is a $9 \mathrm{~m}-8$ and 64 is a $9 \mathrm{~m}+1$. Of course a -3 would be opposite $+125-64-64=-3$. Why do I point this out? To show the number play occuring here: $-125=9 *(-13)-8$ and $64=9 *(7)+1$.

Let me expand upon this using $\mathrm{K}=0$. ' 0 ' can also be formed using $0+(-1)+1$ or $0+(-8)+8$ or of course $0+(-0)+0$. Do you see a pattern here? You can form 0 from addiing any K to it's inverse. So in the case of 0 there are infinitely many of them... any cube plus it's inverse cube plus 0 cubed. The same idea for $+/-$ 1...there are infinitely many because you can plug in another plus it's inverse. Right.

Another easy example is $K=2 ; 343-125-216=2$; that $7^{\wedge} 3 ; 6^{\wedge} 3$ and $5^{\wedge} 5 ; 9 \mathrm{~m} ; 9 \mathrm{~m}-1$ and $9 \mathrm{~m}-8$. So this is the same as saying a $9 \mathrm{~m}+1$ minus a 9 m and a $9 \mathrm{~m}-8$. $10-0-8$ which is $9(1)+1$ plus $-9(0)$ plus $-(9(0)+8)$.

## Forming K with multiples of 27 plus patterns (masking)!

After some serious investigation I realized that I could represent all K (except those of the form $9 \mathrm{~m}+/-4$ and $9 \mathrm{~m}+/-5$ ) as a multiple of 27 plus some combination of $0,1,-1,8$ and -8 . There are some serious patterns that have emerged as I compiled the following chart that will become very useful in my proof concept.

|  | 9m |  | $9 \mathrm{~m}+1$ |  | $9 \mathrm{~m}+2$ |  | $9 \mathrm{~m}+3$ |  | $9 \mathrm{~m}+6$ |  | $9 \mathrm{~m}+7$ |  | $9 \mathrm{~m}+8$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 | 0(27) | 1 | $0(27)+1$ | 2 | $0(27)+1+1$ | 3 | $0(27)+1+1+1$ | 6 | $0(27)+8-1-1$ | 7 | $0(27)+8-1$ | 8 | $0(27)+8$ |
| 9 | $0(27)+8+1$ | 10 | $0(27)+8+1+1$ | 11 | 1(27)-8-8 | 12 | 1(27)-8-8+1 | 15 | $0(27)+8+8-1$ | 16 | $0(27)+8+8$ | 17 | $0(27)+8+8+1$ |
| 18 | 1(27)-8-1 | 19 | 1(27)-8 | 20 | 1(27)-8+1 | 21 | 1(27)-8+1+1 | 24 | 1(27)-1-1-1 | 25 | 1(27)-1-1 | 26 | 1(27)-1 |

| 279 | 10(27)+8+1 | 280 | 10(27)+8+1+1 | 281 | 11(27)-8-8 | 282 | 11(27)-8-8+1 | 285 | $10(27)+8+8-1$ | 286 | 10(27)+8+8 | 287 | 10(27)+8+8+1 |
| 288 | 11(27)-8-1 | 289 | 11(27)-8 | 290 | 11(27)-8+1 | 291 | 11(27)-8+1+1 | 294 | 11(27)-1-1-1 | 295 | 11(27)-1-1 | 296 | 11(27)-1 |
| 297 | 11(27) | 298 | 11(27)+1 | 299 | 11(27)+1+1 | 300 | $11(27)+1+1+1$ | 303 | 11(27)+8-1-1 | 304 | 11(27)+8-1 | 305 | 11(27)+8 |
| 306 | 11(27)+8+1 | 307 | $11(27)+8+1+1$ | 308 | 12(27)-8-8 | 309 | 12(27)-8-8+1 | 312 | 11(27)+8+8-1 | 313 | 11(27)+8+8 | 314 | 11(27)+8+8+1 |
| 315 | 12(27)-8-1 | 316 | 12(27)-8 | 317 | 12(27)-8+1 | 318 | 12(27)-8+1+1 | 321 | 12(27)-1-1-1 | 322 | 12(27)-1-1 | 323 | 12(27)-1 |
| 324 | 12(27) | 325 | 12(27)+1 | 326 | 12(27)+1+1 | 327 | 12(27)+1+1+1 | 330 | 12(27)+8-1-1 | 331 | 12(27)+8-1 | 332 | 12(27)+8 |

My audience will appreciate the importance of this as they read on. Let's point out that each column above, $9 m, 9 m+1,9 m+2,9 m+3,9 m+6,9 m+7$ and $9 m+8$ have three repeating patterns to infinity. I haven't shown it in the above table but this holds true to negative infinity as well. It's not important to explicitly include those. Negatives are just the opposite of positives; they go in the opposite direction on the number line. What do I mean by a repeating pattern? Lets look at 9 m .0 is created by $0 * 27(+0) ; 9$ is created by $0 * 27(+8+1) ; 18$ is created by $1 * 27(-8-1) ; 27$ is created by $1 * 27(+0) ; 36$ is created by $1 * 27(+8+1)$; and 45 is created by $2 * 27(-8-1)$. As you can plainly see there are three $n * 27$ each applying one of the upper patterns/masks ( $+0 ;+8+1$ and $-8-1$ ). This is consistent through the entire chart. So for every K ( except $9 m+4,9 m+5$ ) there is a pattern for it's creation that we now have access to. You'll see why this is important in later sections.

You are likely asking yourself why I am considering this since it is clearly obvious that I am in many cases adding more than 3 cubes, many, many more. It is to show that any legal K's can be created using 1 to infinitely many cubes summed. I have a method to take these excess cubes and shrink them down to a maximum of $3 \ldots$ which is our goal. Your heart will likely skip a beat when you see this connection. I'll lead you into that once I have covered off the preliminaries. It is shockingly easy to understand the concept.

I've decided to go one step further by creating the following chart that lays out the multiples of 27 and the applied patterns that lead to potential cubes to see if there are any observable patterns. Indeed there are...we find there are cubes available in the patterns $0,1,-1,8,-8,10$ and 17 and they appear to display their own density patterns.

Included is another chart that shows there are no similar cubes in any of the other patterns. See the 'headings' in that chart for those patterns. There are clearly 21 patterns... 7 of them result in possible cubes; 14 do not. Without actually showing it in this report you can appreciate that there is something eerily similar happening with the negative K's. But we don't actually need to include that side since it is easily reproducable using subtraction in the positive realm. Right?

Note that I do all my own research in a vacuum and do not consult other's research. This way I am not biased or exclude something important. It also allows me to progress through my own discoveries and branch out accordingly. In the process I am reinventing the wheel for myself. Unfortunately this approach leaves me in the dark as to whether or not others have already made these connections. Prior research into where the problem sits give me a good idea where to push my own research. To date no one seems to have tried to come up with a proof and only seem to be interested in finding a solution for all K from 1 to 1000 . They are using smarter and smarter alogorithms to search them down leaving only a handful.

I believe that my approach will make it easer to come up with extremely fast algorithms that zero in on much more precise locations to start searching, allowing skip-overs of impossible areas. In other words, precision searching; like looking searching through an unsorted list versus a sorted list.

This idea will become crystal clear as I introduce more of my research findings.

In the previous chart we can see that the seven patterns combined touch every single cubed number. And this is not by coincidence. Column 9 m has three hits in every 9 cubes; the rest of the columns have only 1 hit in every 9 . Since there are 7 columns total you can clearly see that there are a combined total of 9 hits for every 9 cubes. This means they are all touched.

This brings us back to a topic we touched on above; and that is the density of 9 m 's. I indicated that there are twice as many as the other patterns/masks. Only now, when looking at only the 'cubes' we see that there are 3 times as many. Interesting. Looking more closely at the chart shows us why this is the case. It appears that is simply the way it works. Some 'Power' has designed it thus! I couldn't resist working that in here...

## Collapsing Infinitely Many Cubes Summed to Just Three Summed

After all this preamble you have likely deduced that you will have to find a combination of up to 3 cubes that are formed by the 7 patterns outlined above. None of the other 14 patterns afford us that option. You at least know that you can exclude $2 / 3$ rds as dead ends. This points us to likely stacks on where to begin our search...but which stacks to consider is our problem. Can we isolate specific combinations that will lead us there? And ignore the remainder? Well, yes we can. Read on.

But that still does not help if we have a large number ( more than 3 cubes ) summed up. By doing this we were able to show that any K can be formed with a combination of infinately many summed 'cubes'. A requirement for this proof is to take those that are more than 3 and somehow reduce them down to that magic number 3...a maximum of 3 cubes only. The idea of having this entire table revolve around multiples of 27 is the key and why I spent the time to set it up that way. Having repeating masks really helps too. The multiples of 27 step up consistantly through each of the columns. We'll have sub-groups with three $\mathrm{x}(27)$...example three 1(27) each one with a different mask ( remember there are three of them repeating ) before jumping up to the next 2(27) where there are three again, and so on. Nice and neat! $0(27)$ is the starting point for each column and the only situation where the sub-group may not contain all 3 masks. But $0(27)$ sets the stage.

I'll begin with a simpler example 11(27) $+0=297=\mathrm{K}$. That's $27+27+27+27+27+27+27+27+27+27+27+0$. Since we are dealing with the easiest of patterns $(+0)$ we are confining/limiting our search to the 9 m column. This lead to the next leap when I asked myself if there was a way to combine the multiples of 27 into three distinct groups that will yield a perfect cube for each...that not only means limiting ourselves to 11 total but any number where the total of +27 s and -27 s is exacly 11 . How about $27(27)-8(27)-8(27)$. This is $27-8-8=11.27(27)=729=9 * 9^{*} 9=9 \wedge 3.8(27)=216=6 * 6^{*} 6=6 \wedge 3$. And guess what; $729-216-216=297 \ldots$ so $\left(9^{\wedge} 3\right)-\left(6^{\wedge} 3\right)-\left(6^{\wedge} 3\right)$. There was no mask to worry about so that eliminated all but the 9 m column $(+0)$.

Let's pick another that is a little more involved...say $98=3(27)+8+8+1$. I quickly see that $125-27=98$ from the previous chart. This means that we can use $4(27)+8+8+1$ and $1(27)+0$. You can see that $4-1$ gives us our magic number of $3(27 \mathrm{~s})$. We also notice that I can take the entire $+8+8+1$ pattern and apply it to the $9 \mathrm{~m}+8$ column entity because 9 m has no such pattern. We can't break this pattern into two distinct patterns since there are none in the seven available masks! We could break it into 3 if we choose to look for $x(27)+/-y(27)+/-z(27)$ to give say $x(27)+8 ; y(27)+8$ and $z(27)+1 \ldots$ but my initial search seems to indicate that path will yield no results. That path is impossible. You can see how this method really simplifies the search. Continuing on we see that $4(27)+8+8+1=125=5 * 5^{*} 5=5^{\wedge} 3$ and $1(27)=27=3^{*} 3^{*} 3=3^{\wedge} 3$. That is $\left(5^{\wedge} 3\right)-\left(3^{\wedge} 3\right)=98$. Right?

How about another one to hammer this point home. This one is going to set loose on the $1,-1,8$ and -8 masks and their interchangablity. Let's look at 47 which is $2(27)-8+1$. If we consult the chart we can see that splitting this into just two parts -8 and +1 will yield no results so we will proceed to three parts and start our search there. This is the same as saying $-8+1+0$; three parts. So we will be looking for something like $\mathrm{x}(27)-8$ $+/-y(27)+1+/-z(27)+0$. Make note here that we have something else to consider when doing our search and
that is with respect to $+/-$. If you want to include a $(-)$ of $a+1$ then you are actually going to be searching the -1 column entities. The same with 8 and -8. I mention that here because you will become confused as to why I picked a number from the -1 instead of the +1 column to solve this one. So I can see a possibility jump out: $343+216-512=47$. That is $13(27)-8+8(27)-19(27)-1$. See how that $(-)$ on the +1 part made it a -1 part? That only happens when you are subtracting the opposite sign. Subtracting a +8 gives -8 ; subtracting a -8 gives +8 and likewise -1 gives +1 . This gives us more variability. $13+8-19=2 \ldots$ so we have the $2(27 \mathrm{~s})$ ! That variability allows us to search both $+1,-1$ when searching any ' 1 ' whether or not it is negative...the same with 8 and -8 . BUT, depending on how you intend to apply the sign will dictate which of the two masks to search. This is a little difficult to understand suffice to say it is not a free for all and continues to severely limit our searches. I've only included this to explain how I can manipulate $a+1$ search to a -1 search by subtracting that cube. The opposite is also true going from -1 to +1 . Of course we can do the same with +8 and -8 . I guess what I'm confusing is that we can initially search both signs for potential candidates then isolate the exact column with sign manipulation.

The above three examples should be sufficient to show the concept of how we can reduce many summed cubes down to our requirement of no more than 3 . We can do this for all legal K's whether or not they are positive or negative. The only problem remains in that we may have to search out to extremely large numbers before coming accross a solution. Because of the repeating nature of those charts there will eventually be some combination following the above approach that will yield results.

If we apply my approach to the recently discovered $\mathrm{k}=30 \ldots$ which is not too far into monstrous numbers we can see my approach at work. Is it a valid approach? Others have found that $\mathrm{K}=30=(2220422932)^{\wedge} 3$ -(2218888517)^3-(283059965)^3.
$\mathrm{K}=30=1(27)+1+1+1$. So applying my approach we will be looking for something like $\mathrm{x}(27)+1$ plus $y(27)+1$ plus $z(27)+1$. But remember that it is legal for us to subtract $(-1) s$ to give us access to +1 . In this case they found a solution that resembled $x(27)+1$ subtract $y(27)-1$ subtract $z(27)-1$ ? But I quickly consulted my chart and it appears that there are no possible solutions using just entries from $+/-1$. So something else must be occuring! Let's see if I can easily figure out what masks were used to arrive at these numbers.
$(2220422932)^{\wedge} 3=10,947,302,325,566,084,787,191,541,568=405,455,641,687,632,769,895,983,021(27)+1$ $(2218888517)^{\wedge} 3=10,924,622,727,902,378,924,946,084,413=404,615,656,588,976,997,220,225,349(27)-10$ $(283059965)^{\wedge} 3=22,679,597,663,705,862,245,457,125=839,985,098,655,772,675,757,671(27)+8$

This is interesting because it did not do as I expected. Instead it added another angle of complexity. This new twist does conform to my approach and simply adds to the validity of the 'proof I'm trying to present. So untimately the 'smallest' solution to 30 was found to be of the form $\mathrm{x}(27)+1$ subtract $\mathrm{y}(27)-10$ subtract $\mathrm{z}(27)+8$. Do you see how this relates to my approach? The x-y-z still works out to 1 . So we continue to have 1(27)! But the masks are strange at first glance, right? Not really, when you realize that the ultimate mask $+1+1+1$ must result from the summing of the individual masks. So we have +1 subtract -10 subtract $8 \ldots$ or $(+1)-(-8-1-1)-$ $(+8)$ which is actually $+1+8+1+1-8$ which reduces to $1+1+1$. Cool, eh?

I hadn't considered that we could do that to the mask and am mighty pleased I looked at $\mathrm{K}=30$ for verification. That openned up many new doors to potential solutions.

With all this research I will have to question whether or not a solution for $\mathrm{K}=30$ couldn't be found using the $+1+1+1$ split into three +1 's, but as I noted above a quick glance at my own charts would indicate it is impossible. What I do want to point out is that $+8+1+1$ and -8 are both masks along with +1 that appear as the three repeating masks for the +1 column. Right? So in effect we are actually doing three +1 s . What happens when we subtract a mask allows us to consider other stacks...in the case of -8 , it let's us consider entries in $9 \mathrm{~m}+8$, right? This is becoming a tad bit confusing yet manageable.

The above example for $\mathrm{K}=30$ makes it easier to see how subtracting a mask can turn it into another mask. This idea of subtracting allows us to introduce all the negative K's into the proof. Without doing any further work specifically on $-K$, we can easily show that we can create that -K by inverting what we did to get
+K . Right? A quick example could be $\mathrm{K}=27=1(27)+0 ;-\mathrm{K}=-27=($ Subtract $)\{1(27)+0\} . \mathrm{K}=0+\mathrm{K} ;-\mathrm{K}=0-\mathrm{K}$.

## Conclusion

This approach should be sufficient to prove that for those $K$ that are legal ( not $9 m+4,9 m+5,9 m-4$ and $9 \mathrm{~m}-5$ ) we have repeating patterns consisting of repeating masks that afford us the opportunity to create any of them using a multiple of 27 plus a mask... $x(27)+$ mask. This proves that for all $K$ that we seek there is a specific form. These specific forms are simply a structured way to form any of them using nothing but cubes. The actual number of cubes at this point is not important. We simply want to prove to ourselves that there are solutions that can be formed using nothing but cubes.

Once that was established it was important to show that these could actually be reduced to 3 or fewer. I believe I have successfully proved that with my above multiple of 27 plus mask. There is always a way to rewrite a complicated large number of cubes as three or less. Exactly what we want to prove.

The meat and bones of this proof is that each of the reduced cube forms (max three of them, now!) can already be found somewhere. My writing them in the original starting form $x(27)+$ mask allows us to reduce to at most three that take the form $x(27)+$ mask as well. Logic dictates that when creating the charts all these forms were already accounted for. So those three new forms are already out there. Given enough time searching one could locate a solution. With the approach I've taken, I have shown without a doubt, that they are out there. They exist. They may be difficult to find and/or become very large numbers, but they are there.

Once the concept of masking and multiples of 27 were injected into the proof it naturally unfolded into something that was easily manageable.

This 'proof' could be used to find faster ways to identify combinations of cubes for whatever K you are searching. I believe you can also use this proof to predict the 'density' of that K as well. I wasn't interested with researching that component simply because one could deduce infinite solutions by looking at the 'masks' and the number of cubes required. For example if $K=27=3^{\wedge} 3+0^{\wedge} 3+0^{\wedge} 3 \ldots$..really one cube...makes infinite solutions possible because the other two can hold a K and it's -K cancelling each other out. 27+64-64; 27+125-125; $27+8-8 ; \ldots$ You get the idea.

Ultimately, I have shown that all legal $+/-K$ can be reduced to a maximum of 3 cubes which are already defined and redily available. So this is the Proof!

I hope you enjoyed my presentation of this proof.
