A text is a manifold
——a solution of some unsolvable questions

Zhicheng Yu (Strongart)

Abstract: This paper is about my original proposition: a text is a manifold, which can solve some unsolvable philosophical questions.

(1)

A text is a manifold, all characters have their own world.

The text is also embedded in a world, the dimension of the world is larger than the worlds of characters, but they may have the same enough information.

Model: the points in the place are the same as the points in a (infinite) line, the world is infinite!

There are many characters in the world, they reach their worlds by their charts.

A property can have different representations in the different charts.

If all the representations of a property P are equivalence in any charts, we call the P a property of the whole text. Otherwise, it is only the property of some concrete charts.

（2）

The matter and the consciousness, which one is fundamental?

In the chart of the matter, consciousness depends on the brain which is a kind of the matter, so the matter dominates the consciousness.

In the chart of the consciousness, the matter appears by perceive which is a kind of the consciousness, so the consciousness dominates the matter.

We will not meat the question in our daily life, because they the equivalence in the most case.

Even in the science, you can say that the natural law is the rule of the matter or the custom in the phenomenon.

If we do not dig the source, we can make everything well, but the philosophers want to dig.

Some philosophers emphasize some charts and fight against the opposite one, some philosophers create some new charts, which can cover the question, but also has their own problems.

（3）

In the most case, the whole picture is not trivial, so you can not expect one chart could describe all the text.

The basic model is a stereographic projection, you can not cover a sphere by a plane, but you can cover a sphere with a hole.

One chart can cover most of the text, but at least there is a point you can not reach, which is the infinite point of your world, the antipose of your character.

In the most case, the infinite part is not only a point, maybe the manifold is more complicated or you have no enough energy to extend to the end of your chart.

Most close ,more truth. You are always right in your area, so do your players. For the middle area, debeat or translation, that is the question.

<div align="center">（4）</div>

If you want to reach the infinite part, you should change your chart, there are some examples:

Ego must be recognized by others.   （Lacan's claim）

God's view can explain everything, but can not reach the God.

How can you get the same result from the different charts? The equivalent property will help you.

Only the equivalent property is meaningful for the all manifold, it can be recognized from every chart.

How can we check every chart? Because of the common belief, we check any other chart instead of every chart.

Others automatically help us to do the chart translation, in the most cases, you can recognize the world from your chart.

A word is a equivalent property for who use the language, the private language is trivial.

Metaphysics is the first person of a philosopher, other philosophies are the third persons, then the equivalent result can be made from the translation.

（End）

I got these ideals about ten years ago, now I write this English note for summary, it is Wittgenstein's style for my 36th birthday , maybe I do not choose the exact word, but I think the basic ideal is clear for anyone who understands the manifolds in the mathematics.
