# 序言

本书是对相对论、粒子物理和量子场论的充实、完善和进一步发展，总体上采用严格、解析、优美的描述方法，尽量使整个文章具有一种数学和物理的美感。本书前十九章是基础部分，提出了多个十分有用的数学工具，特别是我独立发展和创建了用于物理研究的常数不变张量分析方法，并按我自己的方式重新表述了经典物理，大部分内容属于经典场论和量子力学领域；二十章及之后是高级进阶部分，大部分内容属于量子场论领域，特别是给出了新的量子化程式，此新程式不依赖哈密顿量直接给出量子化规则，本书按此程式完成了任意时空中任意自旋线性粒子的量子化，极大丰富和扩展了量子场论的内容。在此特别说明一点，新的量子化程式本质上属于基于方程的量子化方法，特别适合无法写出哈密顿量的系统进行量子化，是对传统基于作用量量子化方法的补充。对于高自旋粒子一般难于直接写出其哈密顿或拉式量，故而无法直接采用传统基于作用量的量子化方法，但新的量子化程式就可以避开这个困难，可以直接对高自旋粒子进行量子化，并成功建立了相应的高自旋量子场论。

在此新版本中，我改正了前面版本中的多个错误，并严格解析地证明了多年来一直未解决的多个猜想，彻底解决了一系列数学和物理问题，进一步为论文奠定了坚实的数学基础。为此也增加了一些新的章节，导致整个文章越来越长，显得有些繁琐，逻辑也有点混乱，不符合美学，所以我对整个文章进行了比较大的精简和优化。我直接删减了与文章主线无关的几个章节，也删减了多个章节中一些繁琐的内容，也合并或微调了少部分章节的内容，从而突出了主线和精简优化了文章，使文章更具美感和逻辑性。当然，如果读者对删减的章节和内容感兴趣，可以阅读前面的版本。同时我仍采用上一版本的做法，将复杂繁琐的几个推广章节剥离文章主线，放到文章后段。这样既保持了内容的基本完整性，也兼顾了逻辑的流畅性，使读者不会被复杂繁琐问题阻断和产生厌烦，能相对容易并愉快地读下去。这样的安排更符合阅读的规律，也符合美学特征。抓住主线，去掉旁支末节，从简单到复杂，逐渐深入，一步一步推广，深刻完美展示完整的物理和数学内容。

具体来说，在第一至第二章中我独自发展创立了常数不变张量分析法<sup>[1-3]</sup>，发现了某些美妙的数学性质，提出了很多重要有用的常数不变张量，为物理研究提供了一个十分有用的数学工具。在本版新增的第三章中系统讲述了范德蒙矩阵方法<sup>[4]</sup>，为后续求解多个问题提供了有力的数学工具。第四章我继续发展提出了多个重要的复合常数不变张量，并详细研究了它们的各种性质。第五章在高低维时空和无限维表示两个维度上推广了常数不变张量。在第六章中指明了常数不变张量与表象变换之间的本质联系。在第七至十章中我运用前面章节建立的常数不变张量分析法等数学工具，重新表述了电磁场、Yang-Mills场、引力场和引力微子场的方程<sup>[5-15]</sup>，提出了多种等价的表述形式<sup>[1,2]</sup>，并严格解析地证明了各种表述形式之间的等价性，特别是分析得到了引力场毕安奇恒等式<sup>[12-15]</sup>的旋量形式。

第十一章是本书的重中之重，也是我最开始写作此书的初衷。在此章中我独立创新地提出了一种全新的粒子方程表述形式：自旋方程，此方程直接用自旋和自旋张量矩阵构造，并注意到自旋张量同时也是场量相应表示的变换矩阵，所以此方程物理意义十分明确，可以根据粒子场量变换规律简单直接地写出相应的粒子方程，它正确描述了中微子<sup>[6]</sup>、电磁场<sup>[8,9]</sup>、Yang-Mills场<sup>[7]</sup>和电子<sup>[5]</sup>等经典方程，并发现其无质量表示完全等价于全对称的Penrose旋量方程<sup>[1,2]</sup>，当然它比Penrose旋量方程更广泛，可以描述更多物理方程。我继续利用自旋表述这个思想，进一步得到了正确描述Einstein引力场和引力微子的低一阶导数自旋方程。在以上这些自旋表述形式中可以很自然地引入一个标量场，从而推广得到了一个更有意思的方程：开关型自旋方程，在标量场为零时，自由粒子可以存在，在标量场不为零时，自由粒子不存在。此标量场的作用就象开关一样，控制粒子的产生与湮灭，这就为粒子的产生与湮灭提供了一种新的物理机制，同时也能回答宇宙暴涨期<sup>[16]</sup>为何只由标量场就可以完全描述。并且此方程本身对标量场有内在固有的限制，从而使标量场自动量子化，每一种量子化值对应截然不同的物理方程，一种对应经典粒子方程，一种对应类似扭量的方程，一种对应常数平凡解。这为五种超弦<sup>[17]</sup>的统一表述提供了一种新的思路和启示。

在第十二至十三章中我对Penrose旋量方程<sup>[1,2]</sup>、Penrose扭量方程<sup>[3]</sup>和Bargmann-Wigner方程<sup>[18]</sup>进行了全面深入的分析。并在平坦时空中严格证明了Bargmann-Wigner方程在半整数自旋情形<sup>[19,20]</sup>等价于Rarita-Schwinger方程<sup>[21,22]</sup>，在整数自旋情形<sup>[20]</sup>等价于Klein-Gordon方程<sup>[22,23]</sup>，揭示了Bargmann-

Wigner方程的深刻物理内涵。通过对比研究，发现Bargmann-Wigner方程更适合描写有质量粒子，而Penrose旋量方程或自旋方程更适合描写无质量粒子。

第十四章是对前面章节内容的进一步充实和深化，我换成从表象变换的角度去研究同一个物理问题，为后续的各种自旋粒子洛伦兹变换多项式表示的证明提供了一个数学基础，并同时用表象变换技术提出了全新的粒子耦合理论。在第十五章中我对洛伦兹变换<sup>[24-26]</sup>作了细致深入的分析，特别是得到了各种常见自旋粒子洛伦兹变换的多项式表示，为以后各种自旋粒子物理的研究提供了又一个十分有用的数学工具。在第十六至十八章中我建立了自旋代数、螺旋度、特殊拟微分算子和矩阵连乘迹的数学分析，为下一步任意自旋无质量粒子的成功量子化提供了多个十分有用的数学工具。在新增的第十九章中我汇总得到了一系列组合恒等式，并大多给予了系统严格的证明，为物理研究提供了有力实用的数学支持。

在第二十章中，充分运用四维傅里叶变换技巧，汇聚讨论了非相对论性粒子的二次量子化细节。由于大多量子场论的书均没有详细论述Majorana粒子和中微子的量子化<sup>[27]</sup>，我也一直没找到相应内容，为了弥补这个缺憾，决定自己动手推导演算，在第二十一章中我应用洛伦兹推动变换先给出了Dirac粒子的量子化<sup>[27,28]</sup>，然后在此基础上采用类似的技巧又给出了Majorana粒子和中微子的详细量子化细节。2019.8.2 重大灵感产生，在第二十二至二十六章中我应用以上章节创立的数学工具和常数不变张量分析，按新的协变量子化程式成功完成了各种无质量自旋粒子的量子化，特别对标量场和电磁场分别单独一章进行了详细讨论，从而对比经典结果印证了新的量子化程式的合理性和正确性，然后在此基础上对各种无质量自旋粒子按相同、统一的程式成功进行了量子化。

在第二十七至二十九章中，基于Bargmann-Wigner方程并对照无质量粒子量子化的成功经验，对各种有质量自旋粒子按新的程式统一进行了量子化，给出了几种等价场或势的协变对易规则和各种因果函数。在第三十章中，我对各种对称和反对称平面波解采用类似的数学技巧进行了统一的处理和证明。在第三十一章中我重新梳理分析了前面章节各种方程的自旋基，理清了自旋基分解的逻辑推演关系和不同表象下的自旋基分解关系。并进一步论证了自旋基就是一般自旋算符的共同本征态，且自旋基分解系数就是CG系数。在第三十二章中我推广发展了全对称指标的多项式定理，为上一步按新的程式统一量子化有质量粒子提供了数学支持，同时基于历史上Behrends和Fronsdal构造出来的公式<sup>[29,30]</sup>，并结合自己新的结论，得到了一个十分有意义的投影算子猜想。在第三十三至三十五章中，我详细论述了有质量矢量粒子、有质量引力微子和有质量引力子的具体量子化方案和结论。在第三十六至三十九章中，我试着按新的程式去统一量子化所有高、低维时空中的粒子，进行了很多有意义的推广和探索，取得了一系列成果，得到了与四维时空中完全类似的结论。特别是自然而然地涌现出了反对称张量场，这是在我意料之外的一个美妙结论。

在第四十至四十三章中我具体研究了二阶、多重、Dirac型和反对称的完美常数不变张量，进一步发展和丰富了常数不变张量分析法的内容。在第四十四章中，类比无质量情形，我利用Dirac型完美常数不变张量建立了有质量粒子的高旋场量子化方案。以上第四十至四十四章正是我从主线剥离出来的内容，放在此处，感兴趣的读者可以对照前面对应的章节一块阅读，不感兴趣的可以略过。在第四十五章中，我大胆猜测提出了一种新的相互作用，是否正确有待实践验证。

本书的数学和物理都具有较强的原创性，一些数学和物理概念、方法、内容也有一定新颖性，均是我自己本人独立地一步步演算严格建立起来的。比较正规的研究起始时间远的可以追溯到十几年前<sup>[31]</sup>，最早始于2004年5月，那时只是初步建立了目前这个理论体系的基础部分，持续了好几年，但极大地影响了我正常的生活，故一度想把它彻底忘掉，所以中间又断了几年。虽然如此，但是我对理论物理的兴趣依然没有减退，后来从2015年3月起我又开启了新一轮的研究，从那时起连续写作<sup>[32-36]</sup>至今，一直没停。它耗费了我大量的时间与精力，并利用业余时间长期写作而成，在此特别感谢家人多年的理解与支持！由于本书很多课题涉及了全新的领域，具有挑战性和开放性，充满了好多猜想、试探、验证和证明，有些数学和物理问题只是大部分得到了解决，但并没有彻底完全解决。再加上本人水平有限，不能面面俱到，书中难免有错误之处，欢迎大家指正！

备注：从2015年3月起至2022年5月的七年间我想法从未间断过，总有灵感产生，几乎每天都在写作之中。但之后一段时间，没有再像之前几年一样灵感想法不断，并满怀激情。虽然还有几个重要问题没有得到彻底解决，但那段时间研究的激情和强烈的好奇心似乎已离我而去了。也许是思想疲劳了，也许是厌倦了，也许是

想法枯竭了。总之，一下子突然感觉没意思了。故在此之后我没再连续写作，只有零星的进展、研究和写作；在2022年9月初又产生了少些新的灵感，理清和证明了之前的一些猜想，之后只有零星缓慢的进展。

幸好这种情况只持续了近一年，直到2023年7月8日那天之后，灵感又开始不断大量出现了，我进一步发展了高阶、多重和Dirac型等多种完美常数不变张量；在2023年8月15日又产生了一个新的重要灵感，我一下就求出了近三年未解决的两个二元数列的通项公式；在2023年9月5日-9月7日这三天灵感突发，我终于把Dirac矩阵连乘积那一章节的猜想都进行了严格的证明；在2023年9月15日又严密化了一个多项式展开的重要定义并初步证明了一个相关猜想；在2023年10月22日-24日我又提出了B-W方程的高旋量场量子化等价方案；在2023年10月25日-26日我轻松获得并证明了反对称排序规律，由此顺带一举解决了两年前的对称排序猜想，严格证明了它。并基于新的反对称排序规律和之前章节全对称完美常数不变张量内容，类比发展了全反对称完美常数不变张量，使常数不变张量理论得到了进一步扩展和完善。在2023年12月期间，我改正了一个关于因果函数计算方面的错误；在2024年2月20日我偶然看到了关于范德蒙行列式<sup>[4]</sup>的相关知识，并运用此行列式一举解决了求解有关自旋的低阶展开系数问题，同时也成功彻底求出了近三年未解决的第三个二元通项公式。正所谓一点突破，则全面突破，并以点带面，一系列问题得到了彻底地解决；在2024年3月29日至31日期间，我受卡特兰数和范德蒙卷积恒等式的启发和指引，解决了一系列组合学恒等式猜想；在2024年5月3日，一个关于自旋矩阵重要的基本结论终于获得了严格全面的证明，重要一环终于被我彻底补上了。总之，这段时间灵感不断迸发，整体有所进展，很多遗留问题得到了解决。

2024年5月5日小结：经过多年的坚持与努力，绝大多数猜想已被严格证明并彻底获得解决。只留下极少数问题未获彻底解决，如下：一、投影算子猜想(难以解决)；二、高自旋量子场论的角动量算符问题(难以解决)；三、高自旋量子场论的量子方程疑惑(有点疑惑)；四、各种隐含组合恒等式的证明(可以解决但有点难度)。2024年5月5日后物理内容几乎没有新的进展，只有零星的修修补补，修正了一些排版小错误，完善美化了一些版面。除非以后有新的重大突破，这个方面的研究工作基本告一段落了。

# 第一章 常数不变张量分析

自我评述：本章我发展创立了常数不变张量分析方法，我是由已知的一些常数不变张量启发而发展起来的。本章发现了一大批新的基本常数不变张量，并且与物理联系紧密，具有天然的协变性与不变性，使用起来十分方便有用，是物理研究的一个新数学工具，其实我发展这个数学工具的初衷就是要用于物理研究。

## 1 类Penrose抽象指标 [1, 2]

符号约定： $\sim$ 表示洛伦兹变换， $\prec$ 表示矩阵展开为分量， $\succ$ 表示分量收缩为矩阵， $\varsigma = \pm 1$ 。

自我评述：本节是对Penrose抽象指标的发展与推广，将 $\frac{1}{2}$ -自旋指标推广到了一般自旋指标，并引入了双重表示指标，双重表示指标对应无质量粒子的两种表示。这样做的好处是“一式两份”、一个表达两种表示同时呈现、一次处理同时得到两个结果，这样的抽象指标更美、更完备、更有力。

### 1.1 一般表象的厄密自旋矩阵 $\sigma(s)$

$$\sigma(s) \times \sigma(s) = i\sigma(s), \sigma^2(s) = s(s+1), \sigma^+(s) = \sigma(s) \quad (1.1)$$

### 1.2 厄密自旋矩阵的一个具体表象 [37]

$$\sigma(s) = \left( \frac{1}{2} \begin{bmatrix} 0 & A_1 & 0 & 0 & 0 \\ A_1 & 0 & A_2 & 0 & 0 \\ 0 & A_2 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & A_{2s} \\ 0 & 0 & 0 & A_{2s} & 0 \end{bmatrix}, \frac{i}{2} \begin{bmatrix} 0 & -A_1 & 0 & 0 & 0 \\ A_1 & 0 & -A_2 & 0 & 0 \\ 0 & A_2 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & -A_{2s} \\ 0 & 0 & 0 & A_{2s} & 0 \end{bmatrix}, \begin{bmatrix} s & 0 & 0 & 0 & 0 \\ 0 & s-1 & 0 & 0 & 0 \\ 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 0 & -(s-1) & 0 \\ 0 & 0 & 0 & 0 & -s \end{bmatrix} \right) \quad (1.2a)$$

$$A_n = \sqrt{n \cdot \sqrt{2s+1-n}}, n = 1, 2, \dots, 2s; \sigma(s) \prec \sigma_{\alpha_\varsigma k_\varsigma}^{l_\varsigma}(s) \simeq \sigma_{\alpha'_\varsigma k'_\varsigma}^{l'_\varsigma}(s) \quad (1.2b)$$

$$\sigma(s) \times \sigma(s) = i\sigma(s), \sigma^2(s) = s(s+1), \sigma^+(s) = \sigma(s), s = \frac{1}{2}, 1, \frac{3}{2}, 2, \dots \quad (1.2c)$$

与此自旋矩阵相对应的度规张量如下：

$$\varepsilon(s) = \begin{bmatrix} 0 & 0 & 0 & 0 & (-1)^0 \\ 0 & 0 & 0 & (-1)^1 & 0 \\ 0 & 0 & (-1)^2 & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 \\ (-1)^{2s} & 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ \cdots & 0 & 0 & 0 & 0 \\ (-1)^{2s} & 0 & 0 & 0 & 0 \end{bmatrix}, \sigma^*(s) = (-1)^{2s+1} \varepsilon(s) \sigma(s) \varepsilon(s) \quad (1.3)$$

$$\varepsilon(s) \prec \varepsilon_{k_\varsigma l_\varsigma}(s) \simeq \varepsilon^{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon_{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon^{k_\varsigma l_\varsigma}(s), \varepsilon^2(s) = (-1)^{2s} \quad (1.4)$$

自我评述：自旋矩阵选取本质上是有无穷种选法，可以是厄密的，也可以不是厄密的。本书主要采用的是以上特殊表示的厄密自旋矩阵，这样做的理由是量子力学中观测量要求是厄密的，另一个理由是在这种表示自旋矩阵下存在下一章的完美常数不变张量，若采用其它表示的自旋矩阵，得不到这样完美的常数不变张量。事实上一开始我采用的是一个全整数的自旋矩阵，表面上似乎更漂亮，但没有以上两个优点，最终我还是放弃了它而采用了现在的这种厄密表示。

### 1.3 正交标架下洛伦兹变换参数 $\vartheta^{ab}$ 和自旋张量 $S_{ab}(s, \varsigma)$ (本书采用此标架)

$\epsilon \in R$ 表示 $O'$ (粒子)相对 $O$ 的速度， $\omega \in R$ 表示 $O'$ (粒子)相对 $O$ 的旋转角度。

自我评述：这样规定好，物理解释才不会混淆，尤其时间久了，就很容易搞不清参数与真实物理的对应了，一般是差个符号。万一忘了，可以回到此处，正本清源。

$$g_{ab} \simeq g^{ab} \succ \text{diag}(1, 1, 1, 1), x^a \simeq x_a = (x, y, z, it), \vec{\vartheta} \equiv i\omega + \epsilon \quad (1.5a)$$

$$\begin{bmatrix} x' \\ y' \\ z' \\ it' \end{bmatrix} (= x'^a) = e^{\vartheta^a_b} \begin{bmatrix} x \\ y \\ z \\ it \end{bmatrix} (= x^b), \vartheta^a_b \succ \begin{bmatrix} 0 & \omega_z & -\omega_y & i\epsilon_x \\ -\omega_z & 0 & \omega_x & i\epsilon_y \\ \omega_y & -\omega_x & 0 & i\epsilon_z \\ -i\epsilon_x & -i\epsilon_y & -i\epsilon_z & 0 \end{bmatrix} \prec \vartheta_a^b \simeq \vartheta^{ab} \simeq \vartheta_{ab} \succ i\omega \cdot R + \epsilon \cdot L \quad (1.5b)$$

$$\vartheta_{ij} = \varepsilon_{ijk} \omega^k, \omega_k = \frac{1}{2} \varepsilon_{kij} \vartheta^{ij} \quad (1.5c)$$

$$x'^a = (g^a_b + \vartheta^a_b) x^b, x'^a = (g^{ab} + \vartheta^{ab}) x_b, x'_a = (g_a^b + \vartheta_a^b) x_b, x'_a = (g_{ab} + \vartheta_{ab}) x^b \quad (1.5d)$$

$$\begin{cases} \delta x_a = \vartheta_a^b x_b = \vartheta_{ab} x^b, \delta x^a = \vartheta^a_b x^b = \vartheta^{ab} x_b \\ \vec{S}_{abcd} = -i(g_{ac}g_{bd} - g_{ad}g_{bc}) \succ \begin{bmatrix} 0 & R_z(s) & -R_y(s) & -L_x(s) \\ -R_z(s) & 0 & R_x(s) & -L_y(s) \\ R_y(s) & -R_x(s) & 0 & -L_z(s) \\ L_x(s) & L_y(s) & L_z(s) & 0 \end{bmatrix} \end{cases} \quad (1.5e)$$

$$\begin{cases} \delta\varphi(s) = \frac{i}{2}\vartheta^{ab}S_{ab}(s,\varsigma)\varphi(s) = \frac{i}{2}\vartheta_{ab}S^{ab}(s,\varsigma)\varphi(s) \\ S^{ab}(s,\varsigma) \succ \begin{bmatrix} 0 & \sigma_z(s) & -\sigma_y(s) & -\varsigma\sigma_x(s) \\ -\sigma_z(s) & 0 & \sigma_x(s) & -\varsigma\sigma_y(s) \\ \sigma_y(s) & -\sigma_x(s) & 0 & -\varsigma\sigma_z(s) \\ \varsigma\sigma_x(s) & \varsigma\sigma_y(s) & \varsigma\sigma_z(s) & 0 \end{bmatrix} \prec S_{ab}(s,\varsigma) = -i[\sigma(s), \frac{i\varsigma}{2}]_a[\sigma(s), -\frac{i\varsigma}{2}]_b \end{cases} \quad (1.5f)$$

$$\begin{cases} L_{ab} = x_a p_b - x_b p_a \succ \begin{bmatrix} 0 & xp_y - yp_x & -(zp_x - xp_z) & ixE - itp_x \\ -(xp_y - yp_x) & 0 & yp_z - zp_y & iyE - itp_y \\ zp_x - xp_z & -(yp_z - zp_y) & 0 & izE - itp_z \\ -(ixE - itp_x) & -(iyE - itp_y) & -(izE - itp_z) & 0 \end{bmatrix} \\ M_{ab} = L_{ab} + S_{ab}(s,\varsigma) = -i(x_a \partial_b - x_b \partial_a) + S_{ab}(s,\varsigma) \end{cases} \quad (1.5g)$$

自我评述：标架选取本质上也有无穷种选法，常用的也有好几种。本书采用的是本节的正交标架，这样的好处是在这种标架下常数不变张量更简单、更统一、更有规律。当然通过等价变换也可以变换到其它标架表示。

### 1.4.1 伪标架

## 1.5 s-自旋旋量指标

s-自旋旋量指标定义:用阿拉伯小写字母 $\{i, j, k, l, m, n, p, q, r, s\}$ 特别表示一般自旋情形。

$$k_\varsigma \sim e^{\frac{i}{2} \vartheta^{ab} S_{ab}(s, \varsigma)} = e^{(i\omega + \varsigma\epsilon) \cdot \sigma(s)} \Leftrightarrow k_+ := k \sim e^{(i\omega + \epsilon) \cdot \sigma(s)} \quad k_- := k' \sim e^{(i\omega - \epsilon) \cdot \sigma(s)} \quad (1.8)$$

$$k_\varsigma \sim e^{-\frac{i}{2} \vartheta^{ab} S_{ab}^T(s, \varsigma)} = e^{-(i\omega + \varsigma\epsilon) \cdot \sigma^T(s)} \Leftrightarrow k_+ := k \sim e^{-(i\omega + \epsilon) \cdot \sigma^T(s)} \quad k_- := k' \sim e^{-(i\omega - \epsilon) \cdot \sigma^T(s)} \quad (1.9)$$

$$k'_\varsigma \sim e^{\frac{i}{2} \vartheta^{ab} S_{ab}(s, -\varsigma)} = e^{(i\omega - \varsigma\epsilon) \cdot \sigma(s)} \Leftrightarrow k'_+ := k' \sim e^{(i\omega - \epsilon) \cdot \sigma(s)} \quad k'_- := k \sim e^{(i\omega + \epsilon) \cdot \sigma(s)} \quad (1.10)$$

$$k'_\varsigma \sim e^{-\frac{i}{2} \vartheta^{ab} S_{ab}^T(s, -\varsigma)} = e^{-(i\omega - \varsigma\epsilon) \cdot \sigma^T(s)} \Leftrightarrow k'_+ := k' \sim e^{-(i\omega - \epsilon) \cdot \sigma^T(s)} \quad k'_- := k \sim e^{-(i\omega + \epsilon) \cdot \sigma^T(s)} \quad (1.11)$$

指标关系: 指标恒等, 旋量也恒等, 是定义。

$$\begin{cases} k_\varsigma \equiv k'_\varsigma \\ k_{-\varsigma} \equiv k'_\varsigma \end{cases} \quad \begin{cases} k_\varsigma \equiv k'_{-\varsigma} \\ k_{-\varsigma} \equiv k'_\varsigma \end{cases} \quad \begin{cases} k_+ \equiv k'_- \equiv k \\ k_- \equiv k'_+ \equiv k' \end{cases} \quad \begin{cases} k_+ \equiv k'_- \equiv k \\ k_- \equiv k'_+ \equiv k' \end{cases} \quad (1.12)$$

共轭指标: 指标相等, 旋量可能等, 可能不等。而且在特殊的厄密表象下才成立。

$$\begin{cases} (k_\varsigma)^* = k'_\varsigma \\ (k_{-\varsigma})^* = k'_\varsigma \end{cases} \quad \begin{cases} (k'_\varsigma)^* = k_\varsigma \\ (k'_{-\varsigma})^* = k_\varsigma \end{cases} \quad \begin{cases} (k)^* = k' \\ (k')^* = k \end{cases} \quad \begin{cases} (k')^* = k \\ (k)^* = k' \end{cases} \quad (1.13)$$

s-自旋旋量指标对应的度规张量和自洽的升降规则如下:

$$\begin{cases} \varepsilon_{k_\varsigma l_\varsigma}(s) \simeq \varepsilon^{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon_{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon^{k_\varsigma l_\varsigma}(s) \succ \varepsilon(s) \\ \psi_{k_\varsigma} = (-\varsigma)^{2s} \varepsilon_{k_\varsigma l_\varsigma}(s) \psi^{l_\varsigma}, \psi^{k_\varsigma} = \varsigma^{2s} \varepsilon^{k_\varsigma l_\varsigma}(s) \psi_{l_\varsigma} \\ \psi_{k'_\varsigma} = (-\varsigma)^{2s} \varepsilon_{k'_\varsigma l'_\varsigma}(s) \psi^{l'_\varsigma}, \psi^{k'_\varsigma} = \varsigma^{2s} \varepsilon^{k'_\varsigma l'_\varsigma}(s) \psi_{l'_\varsigma} \end{cases} \quad (1.14)$$

自洽的升降规则本质如下, 与Penrose的规则一致, 且Penrose指标与我的指标一致。

$$\begin{cases} \varepsilon_{k'l'}(s) = [\varepsilon_{kl}(s)]^* \simeq \varepsilon_{kl}(s), \varepsilon^{k'l'}(s) = [\varepsilon^{kl}(s)]^* \simeq \varepsilon^{kl}(s) \\ \psi_k = (-1)^{2s} \varepsilon_{kl}(s) \psi^l, \psi^k = \varepsilon^{kl}(s) \psi_l \\ \psi_{k'} = (-1)^{2s} \varepsilon_{k'l'}(s) \psi^{l'}, \psi^{k'} = \varepsilon^{k'l'}(s) \psi_{l'} \end{cases} \quad (1.15)$$

自我评述: 为什么要这样规定新抽象指标的升降规则, 主要考虑是两点, 一是尽量与Penrose抽象指标规则一致; 二是新抽象指标内在自洽性要求的, 也是后面大量常数不变张量实际计算实践的总结与提炼。

## 1.6 $\frac{1}{2}$ -自旋旋量指标

$\frac{1}{2}$ -自旋旋量指标是s-自旋旋量指标的特例, 为了与Penrose抽象指标一致, 仍用阿拉伯大写字母 $\{A, B, C, \dots\}$ 特别表示 $\frac{1}{2}$ -自旋情形, 定义与规则如上节所示(取 $s = \frac{1}{2}$ )。

## 1.7 复矢量指标

光子自旋矩阵:用希腊字母 $\{\alpha, \beta, \gamma, \dots\}$ 特别表示复矢量指标。

$$\gamma = \left\{ \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i \\ 0 & 0 & 0 \\ -i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 \\ i & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \right\} \quad (1.16)$$

形式上取 $\sigma(1) = \gamma$ , 得复矢量指标如下:

$$\alpha_{\zeta} \sim e^{(i\omega + \epsilon)\cdot\gamma} \quad \Leftrightarrow \alpha_{+} := \alpha \sim e^{(i\omega + \epsilon)\cdot\gamma} \quad \alpha_{-} := \alpha' \sim e^{(i\omega - \epsilon)\cdot\gamma} \quad (1.17)$$

$$\alpha'_{\zeta} \sim e^{(i\omega - \epsilon)\cdot\gamma} \quad \Leftrightarrow \alpha'_{+} := \alpha' \sim e^{(i\omega - \epsilon)\cdot\gamma} \quad \alpha'_{-} := \alpha \sim e^{(i\omega + \epsilon)\cdot\gamma} \quad (1.18)$$

指标关系:

$$\alpha_{\zeta} \equiv \alpha'_{-\zeta}, \alpha_{-\zeta} \equiv \alpha'_{\zeta}; \alpha_{+} \equiv \alpha'_{-} \equiv \alpha, \alpha_{-} \equiv \alpha'_{+} \equiv \alpha \quad (1.19)$$

共轭关系:

$$(\alpha_{\zeta})^* \equiv \alpha'_{\zeta}, (\alpha'_{\zeta})^* \equiv \alpha_{\zeta}; (\alpha)^* \equiv \alpha', (\alpha')^* \equiv \alpha \quad (1.20)$$

复矢量指标对应的度规张量及升降规则:

$$\left\{ \begin{array}{l} g_{\alpha_{\zeta}\beta_{\zeta}} = \delta_{\alpha_{\zeta}\beta_{\zeta}} \succ I, g^{\alpha_{\zeta}\beta_{\zeta}} = \delta^{\alpha_{\zeta}\beta_{\zeta}} \succ I \\ g_{\alpha'_{\zeta}\beta'_{\zeta}} = \delta_{\alpha'_{\zeta}\beta'_{\zeta}} \succ I, g^{\alpha'_{\zeta}\beta'_{\zeta}} = \delta^{\alpha'_{\zeta}\beta'_{\zeta}} \succ I \end{array} \right\}, \left\{ \begin{array}{l} \psi_{\alpha_{\zeta}} = g_{\alpha_{\zeta}\beta_{\zeta}}\psi^{\beta_{\zeta}}, \psi^{\alpha_{\zeta}} = g^{\alpha_{\zeta}\beta_{\zeta}}\psi_{\beta_{\zeta}} \\ \psi_{\alpha'_{\zeta}} = g_{\alpha'_{\zeta}\beta'_{\zeta}}\psi^{\beta'_{\zeta}}, \psi^{\alpha'_{\zeta}} = g^{\alpha'_{\zeta}\beta'_{\zeta}}\psi_{\beta'_{\zeta}} \end{array} \right\} \quad (1.21)$$

此时度规张量是单位矩阵, 可以不用区分逆变和协变张量, 即上标与下标可以随意同步调换。

自我评述: 复矢量指标来源于对电磁场、Yang-Mills场和引力场的描述, 所以也特别适合描述它们。

## 1.8 矢量指标

空间旋转矩阵 $\mathbf{R}$ 和洛伦兹推动矩阵 $\mathbf{L}$ :

$$\mathbf{R} = \left\{ \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i & 0 \\ 0 & 0 & 0 & 0 \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 & 0 \\ i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \right\}, \mathbf{L} = \left\{ \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & i \\ 0 & 0 & 0 & 0 \\ 0 & -i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & i \\ 0 & 0 & 0 & 0 \\ 0 & 0 & -i & 0 \end{bmatrix} \right\} \quad (1.22)$$

矢量指标如下:用阿拉伯小写字母 $\{a, b, c, d, e, f, g, h, u, v, w\}$ 特别表示矢量指标。

$$a_{\zeta} \sim e^{(i\omega \cdot R + \epsilon \cdot L)} \quad \Leftrightarrow a_{+} := a \sim e^{\vartheta} = e^{(i\omega \cdot R + \epsilon \cdot L)} \quad a_{-} := a' \sim e^{\vartheta^*} = e^{(i\omega \cdot R - \epsilon \cdot L)} \quad (1.23)$$

$$a'_{\zeta} \sim e^{(i\omega \cdot R - \epsilon \cdot L)} \quad \Leftrightarrow a'_{+} := a' \sim e^{\vartheta^*} = e^{(i\omega \cdot R - \epsilon \cdot L)} \quad a'_{-} := a \sim e^{\vartheta} = e^{(i\omega \cdot R + \epsilon \cdot L)} \quad (1.24)$$

指标关系:

$$a_{\zeta} \equiv a'_{-\zeta}, a_{-\zeta} \equiv a'_{\zeta}; a_{+} \equiv a'_{-} \equiv a, a_{-} \equiv a'_{+} \equiv a' \quad (1.25)$$

共轭关系:

$$(a_{\zeta})^* \equiv a'_{\zeta}, (a'_{\zeta})^* \equiv a_{\zeta}; (a)^* \equiv a', (a')^* \equiv a \quad (1.26)$$

矢量指标对应的度规张量及升降规则:

$$\left\{ \begin{array}{l} g_{a_{\zeta}b_{\zeta}} = \delta_{a_{\zeta}b_{\zeta}} \succ I, g^{a_{\zeta}b_{\zeta}} = \delta^{a_{\zeta}b_{\zeta}} \succ I \\ g_{a'_{\zeta}b'_{\zeta}} = \delta_{a'_{\zeta}b'_{\zeta}} \succ I, g^{a'_{\zeta}b'_{\zeta}} = \delta^{a'_{\zeta}b'_{\zeta}} \succ I \end{array} \right\}, \left\{ \begin{array}{l} \psi_{a_{\zeta}} = g_{a_{\zeta}b_{\zeta}}\psi^{b_{\zeta}}, \psi^{a_{\zeta}} = g^{a_{\zeta}b_{\zeta}}\psi_{b_{\zeta}} \\ \psi_{a'_{\zeta}} = g_{a'_{\zeta}b'_{\zeta}}\psi^{b'_{\zeta}}, \psi^{a'_{\zeta}} = g^{a'_{\zeta}b'_{\zeta}}\psi_{b'_{\zeta}} \end{array} \right\} \quad (1.27)$$

此时度规张量是单位矩阵, 可以不用区分逆变和协变张量, 即上标与下标可以随意同步调换。

## 2 常用矩阵

### 2.1 泡利矩阵

$$[\sigma_{\alpha_{\zeta}}, \sigma_{\beta_{\zeta}}] = 2i\epsilon_{\alpha_{\zeta}\beta_{\zeta}\gamma_{\zeta}}\sigma_{\gamma_{\zeta}}, \{\sigma_{\alpha_{\zeta}}, \sigma_{\beta_{\zeta}}\} = 2\delta_{\alpha_{\zeta}\beta_{\zeta}}, \sigma^2(\frac{1}{2}) = \frac{1}{2}(\frac{1}{2} + 1) \quad (1.29)$$

## 2.2 光子矩阵

$$\gamma = \left\{ \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i \\ 0 & 0 & 0 \\ -i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 \\ 0 & 0 & 0 \\ i & 0 & 0 \end{bmatrix} \right\}, \text{tr}(\gamma_{\alpha_\zeta}) = 0, \text{tr}(\gamma_{\alpha_\zeta} \gamma_{\beta_\zeta}) = 2\delta_{\alpha_\zeta \beta_\zeta} \quad (1.30)$$

## 2.3 旋转生成元矩阵

空间旋转生成元矩阵:

$$R = \left\{ \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i & 0 \\ 0 & 0 & 0 & 0 \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 & 0 \\ 0 & 0 & 0 & 0 \\ i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \right\}, \text{tr}(R_{\alpha_\zeta}) = 0, \text{tr}(R_{\alpha_\zeta} R_{\beta_\zeta}) = 2\delta_{\alpha_\zeta \beta_\zeta} \quad (1.32a)$$

$$[R_{\alpha_\zeta}, R_{\beta_\zeta}] = i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta R_{\gamma_\zeta}, [L_{\alpha_\zeta}, L_{\beta_\zeta}] = i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta R_{\gamma_\zeta}, [R_{\alpha_\zeta}, L_{\beta_\zeta}] = [L_{\alpha_\zeta}, R_{\beta_\zeta}] = i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta L_{\gamma_\zeta} \quad (1.32c)$$

$$R^2 = \text{diag}(2, 2, 2, 0), L^2 = \text{diag}(1, 1, 1, 3), R \cdot L = 0, L \cdot R = 0 \quad (1.32d)$$

## 2.4 SO(4)群生成元矩阵

SO(4)群生成元矩阵的正分支:

$$\sigma_+ = R + L = \left\{ \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i & 0 \\ 0 & 0 & 0 & i \\ 0 & -i & 0 & 0 \\ 0 & -i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 & 0 \\ i & 0 & 0 & 0 \\ 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \end{bmatrix} \right\} \quad (1.33a)$$

$$\sigma_+ = \{-\sigma_y \otimes \sigma_x, -I \otimes \sigma_y, \sigma_y \otimes \sigma_z\}, \text{tr}(\sigma_{+\alpha_\zeta}) = 0, \text{tr}(\sigma_{+\alpha_\zeta} \sigma_{+\beta_\zeta}) = 4\delta_{\alpha_\zeta \beta_\zeta} \quad (1.33b)$$

SO(4)群生成元矩阵的负分支:

$$\sigma_- = R - L = \left\{ \begin{bmatrix} 0 & 0 & 0 & -i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ i & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i & 0 \\ 0 & 0 & 0 & -i \\ -i & 0 & 0 & 0 \\ 0 & i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 & 0 \\ i & 0 & 0 & 0 \\ 0 & 0 & 0 & -i \\ 0 & 0 & i & 0 \end{bmatrix} \right\} \quad (1.34a)$$

$$\sigma_- = \{\sigma_x \otimes \sigma_y, -\sigma_z \otimes \sigma_y, \sigma_y \otimes I\}, \text{tr}(\sigma_{-\alpha_\zeta}) = 0, \text{tr}(\sigma_{-\alpha_\zeta} \sigma_{-\beta_\zeta}) = 4\delta_{\alpha_\zeta \beta_\zeta} \quad (1.34b)$$

SO(4)群生成元矩阵两个分支间的关系。

$$[\sigma_{+\alpha_\zeta}, \sigma_{+\beta_\zeta}] = i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \sigma_{+\gamma_\zeta}, \{\sigma_{+\alpha_\zeta}, \sigma_{+\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta}, \sigma_+^2 = \frac{1}{2}(\frac{1}{2} + 1) \quad (1.35a)$$

$$[\sigma_{-\alpha_\zeta}, \sigma_{-\beta_\zeta}] = i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \sigma_{-\gamma_\zeta}, \{\sigma_{-\alpha_\zeta}, \sigma_{-\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta}, \sigma_-^2 = \frac{1}{2}(\frac{1}{2} + 1) \quad (1.35b)$$

$$[\sigma_{+\alpha_\zeta}, \sigma_{-\beta_\zeta}] = [\sigma_{-\alpha_\zeta}, \sigma_{+\beta_\zeta}] = 0 \quad (1.35c)$$

SO(4)群生成元矩阵的统一表示

$$\sigma_\zeta = \left\{ \begin{bmatrix} 0 & 0 & 0 & i\zeta \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i\zeta & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i & 0 \\ 0 & 0 & 0 & i\zeta \\ -i & 0 & 0 & 0 \\ 0 & -i\zeta & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 & 0 \\ i & 0 & 0 & 0 \\ 0 & 0 & 0 & i\zeta \\ 0 & 0 & -i\zeta & 0 \end{bmatrix} \right\} \quad (1.36a)$$

$$[\sigma_{\kappa\alpha_\zeta}, \sigma_{\tau\beta_\zeta}] = i\delta_{\kappa\tau} \varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \sigma_{\kappa\gamma_\zeta}, \{\sigma_{\kappa\alpha_\zeta}, \sigma_{\tau\beta_\zeta}\} = 2\delta_{\kappa\tau} \delta_{\alpha_\zeta \beta_\zeta}, \sigma_\zeta^2 = \frac{1}{2}(\frac{1}{2} + 1) \quad (1.36b)$$

推论2.4.1.  $\sigma_{\zeta\beta_\zeta}^{ab} = \sigma_\zeta^a | \beta_\zeta^b = \left\{ \begin{bmatrix} 0 & 0 & 0 & i\zeta \\ 0 & 0 & i & 0 \\ 0 & -i & 0 & 0 \\ 0 & 0 & 0 & i\zeta \end{bmatrix}, \begin{bmatrix} 0 & 0 & -i & 0 \\ 0 & 0 & 0 & i\zeta \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & i\zeta \end{bmatrix}, \begin{bmatrix} 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & i\zeta \\ 0 & 0 & -i\zeta & 0 \end{bmatrix}, \begin{bmatrix} -i\zeta & 0 & 0 & 0 \\ 0 & -i\zeta & 0 & 0 \\ 0 & 0 & -i\zeta & 0 \\ 0 & 0 & 0 & -i\zeta \end{bmatrix} \right\}$

推论2.4.2.  $\sigma_{-\zeta\beta'_\zeta}^{ab} = \sigma_{-\zeta}^a | \beta'_\zeta^b = \left\{ \begin{bmatrix} 0 & 0 & 0 & -i\zeta \\ 0 & 0 & i & 0 \\ 0 & -i & 0 & 0 \\ 0 & 0 & 0 & -i\zeta \end{bmatrix}, \begin{bmatrix} 0 & 0 & -i & 0 \\ 0 & 0 & 0 & -i\zeta \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & -i\zeta \end{bmatrix}, \begin{bmatrix} 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \\ 0 & 0 & 0 & -i\zeta \\ 0 & 0 & -i\zeta & 0 \end{bmatrix}, \begin{bmatrix} i\zeta & 0 & 0 & 0 \\ 0 & i\zeta & 0 & 0 \\ 0 & 0 & i\zeta & 0 \\ 0 & 0 & 0 & i\zeta \end{bmatrix} \right\}$

自我评述：这对常数不变张量本质上就是SO(4)两个生成元矩阵；特霍夫特也用过，叫特霍夫特 $\eta$ 矩阵；这对常数不变张量也出现于圈量子引力中Ashtekar作用量的构造，不过他们没叫常数不变张量。在这里它出现的地方更多，无处不在，应用十分广泛，是一个十分有用的基本常数不变张量，与自旋矩阵密切相关。应用它们也可以得到电磁场、Yang-Mills场方程的一种新表述-整旋量表述。

## 3 常数不变张量的发现与证明

### 3.1 各种常见度规常数不变张量

自我评述：这节的常数不变张量在我发展这个数学理论之前已经存在于数学与物理中了，我正是受它们和Penrose旋量分析的启发，才想发展出一般的常数不变张量理论，并应用到物理中，为物理研究提供一个有用

的数学工具。

### 3.1.1 四矢量度规常数不变张量 $\delta_{a_\zeta b_\zeta}, \delta^{a_\zeta b_\zeta}, \delta_{a'_\zeta b'_\zeta}, \delta^{a'_\zeta b'_\zeta}$

定理3.1.1.  $I_4 = e^{(i\omega \cdot R + \zeta \epsilon \cdot L)} I_4 e^{(i\omega \cdot R + \zeta \epsilon \cdot L)^T}$ , 即  $\delta_{a_\zeta b_\zeta}, \delta^{a_\zeta b_\zeta}$  是常数不变张量。

推论3.1.1.  $I_4 = e^{(i\omega \cdot R - \zeta \epsilon \cdot L)} I_4 e^{(i\omega \cdot R - \zeta \epsilon \cdot L)^T}$ , 即  $\delta_{a'_\zeta b'_\zeta}, \delta^{a'_\zeta b'_\zeta}$  是常数不变张量。

### 3.1.2 复矢量度规常数不变张量 $\delta_{\alpha_\zeta \beta_\zeta}, \delta^{\alpha_\zeta \beta_\zeta}, \delta_{\alpha'_\zeta \beta'_\zeta}, \delta^{\alpha'_\zeta \beta'_\zeta}$

定理3.1.2.  $I_3 = e^{(i\omega + \zeta \epsilon) \cdot \gamma} I_3 e^{(i\omega + \zeta \epsilon) \cdot \gamma^T}$ , 即  $\delta_{\alpha_\zeta \beta_\zeta}, \delta^{\alpha_\zeta \beta_\zeta}$  是常数不变张量。

推论3.1.2.  $I_3 = e^{(i\omega - \zeta \epsilon) \cdot \gamma} I_3 e^{(i\omega - \zeta \epsilon) \cdot \gamma^T}$ , 即  $\delta_{\alpha'_\zeta \beta'_\zeta}, \delta^{\alpha'_\zeta \beta'_\zeta}$  是常数不变张量。

### 3.1.3 s-旋量度规常数不变张量 $\varepsilon^{k_\zeta l_\zeta}(s), \varepsilon_{k_\zeta l_\zeta}(s), \varepsilon_{k'_\zeta l'_\zeta}(s), \varepsilon^{k'_\zeta l'_\zeta}(s)$

引理3.1.1.  $\sigma^T(s) = (-1)^{2s+1} \varepsilon(s) \sigma(s) \varepsilon(s)$

定理3.1.3.  $\varepsilon(s) = e^{(i\omega + \zeta \epsilon) \cdot \sigma(s)} \varepsilon(s) e^{(i\omega + \zeta \epsilon) \cdot \sigma^T(s)}$ , 即  $\varepsilon^{k_\zeta l_\zeta}(s)$  是常数不变张量。

推论3.1.3.  $\varepsilon(s) = e^{(i\omega - \zeta \epsilon) \cdot \sigma(s)} \varepsilon(s) e^{(i\omega - \zeta \epsilon) \cdot \sigma^T(s)}$ , 即  $\varepsilon_{k'_\zeta l'_\zeta}(s)$  是常数不变张量。

推论3.1.4.  $\varepsilon(s) = e^{-(i\omega + \zeta \epsilon) \cdot \sigma^T(s)} \varepsilon(s) e^{-(i\omega + \zeta \epsilon) \cdot \sigma(s)}$ , 即  $\varepsilon_{k_\zeta l_\zeta}(s)$  是常数不变张量。

推论3.1.5.  $\varepsilon(s) = e^{-(i\omega - \zeta \epsilon) \cdot \sigma^T(s)} \varepsilon(s) e^{-(i\omega - \zeta \epsilon) \cdot \sigma(s)}$ , 即  $\varepsilon^{k'_\zeta l'_\zeta}(s)$  是常数不变张量。

### 3.1.4 反对称 $\frac{1}{2}$ -旋量度规张量 $\varepsilon^{A_\zeta B_\zeta}, \varepsilon_{A_\zeta B_\zeta}, \varepsilon_{A'_\zeta B'_\zeta}, \varepsilon^{A'_\zeta B'_\zeta}$

上节取  $s = \frac{1}{2}$  可得:  $\varepsilon^{A_\zeta B_\zeta}, \varepsilon_{A_\zeta B_\zeta}, \varepsilon_{A'_\zeta B'_\zeta}, \varepsilon^{A'_\zeta B'_\zeta}$  是常数不变张量。

## 3.2 基本定理一及其相关常数不变张量

### 3.2.1 引理

引理3.2.1.  $\vartheta_a^b(\Gamma, i\zeta)_b \equiv (-\omega \times \Gamma - \zeta \epsilon, -i\epsilon \cdot \Gamma)_a, \vartheta_a^b \succ \vartheta \equiv (i\omega \cdot R + \epsilon \cdot L)$

引理3.2.2.  $\frac{1}{2} i\omega \cdot [\Gamma, \Gamma_{\alpha_\zeta}] = (\omega \times \Gamma)_{\alpha_\zeta}, \forall \omega \rightarrow 0 \Leftrightarrow [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = 2i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta}$

引理3.2.3.  $\frac{1}{2} \epsilon \cdot \{\Gamma, \Gamma_{\alpha_\zeta}\} = \epsilon_{\alpha_\zeta}, \forall \epsilon \rightarrow 0 \Leftrightarrow \{\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta}$

引理3.2.4.  $\vartheta_{ij} = \varepsilon_{ijk} \omega^k, \vartheta_{i\pi} = i\epsilon_i, \vartheta_{\pi j} = -i\epsilon_j, \omega_k = \frac{1}{2} \varepsilon_{kij} \vartheta^{ij}$

### 3.2.2 基本定理一

在4维时空中存在如下定理:

定理3.2.1.  $(\Gamma, i\zeta)_a = [e^{(i\omega \cdot R + \epsilon \cdot L)}]_a^b e^{(i\omega + \zeta \epsilon) \cdot \frac{1}{2} \Gamma} (\Gamma, i\zeta)_b e^{-(i\omega - \zeta \epsilon) \cdot \frac{1}{2} \Gamma} \Leftrightarrow \begin{cases} [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = 2i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta} \\ \{\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta} \end{cases}$

证明:  $(\Gamma, i\zeta)_a = [e^{(i\omega \cdot R + \epsilon \cdot L)}]_a^b e^{(i\omega + \zeta \epsilon) \cdot \frac{1}{2} \Gamma} (\Gamma, i\zeta)_b e^{-(i\omega - \zeta \epsilon) \cdot \frac{1}{2} \Gamma}, \forall \omega, \forall \epsilon$

$\Leftrightarrow (\Gamma, i\zeta)_a = (\delta_a^b + \vartheta_a^b)(1 + (i\omega + \zeta \epsilon) \cdot \frac{1}{2} \Gamma) (\Gamma, i\zeta)_b (1 - (i\omega - \zeta \epsilon) \cdot \frac{1}{2} \Gamma), \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow 0 = \vartheta_a^b (\Gamma, i\zeta)_b + \frac{1}{2} i\omega \cdot [\Gamma, (\Gamma, i\zeta)_a] + \frac{1}{2} \epsilon \cdot \{\Gamma, (\Gamma, i\zeta)_a\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow 0 = (-\omega \times \Gamma - \zeta \epsilon, -i\epsilon \cdot \Gamma)_a + \frac{1}{2} i\omega \cdot [\Gamma, (\Gamma, i\zeta)_a] + \frac{1}{2} \epsilon \cdot \{\Gamma, (\Gamma, i\zeta)_a\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow 0 = (-\omega \times \Gamma - \zeta \epsilon)_{\alpha_\zeta} + \frac{1}{2} i\omega \cdot [\Gamma, \Gamma_{\alpha_\zeta}] + \frac{1}{2} \epsilon \cdot \{\Gamma, \Gamma_{\alpha_\zeta}\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow \frac{1}{2} i\omega \cdot [\Gamma, \Gamma_{\alpha_\zeta}] = (\omega \times \Gamma)_{\alpha_\zeta}, \frac{1}{2} \epsilon \cdot \{\Gamma, \Gamma_{\alpha_\zeta}\} = \epsilon_{\alpha_\zeta}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = 2i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta}, \{\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta}$  □

以上定理表明: 对易关系  $[\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = 2i\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta}$  和反对易关系  $\{\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}\} = 2\delta_{\alpha_\zeta \beta_\zeta}$  意味着  $(\Gamma, i\zeta)_a$  是常数不变张量, 反之亦然。

### 3.2.3 常数不变张量 $(\sigma, i\zeta)_a^{A_\zeta A'_\zeta}, (\sigma, -i\zeta)_a^{A'_\zeta A_\zeta}$ [1, 2]

推论3.2.1.  $(\sigma, i\zeta)_a = [e^{(i\omega \cdot R + \epsilon \cdot L)}]_a^b e^{(i\omega + \zeta \epsilon) \cdot \frac{1}{2}\sigma} (\sigma, i\zeta)_b e^{-(i\omega - \zeta \epsilon) \cdot \frac{1}{2}\sigma}$ , 即  $(\sigma, i\zeta)_a^{A_\zeta A'_\zeta}$  是常数不变张量。

推论3.2.2.  $(\sigma, -i\zeta)_a = [e^{(i\omega \cdot R + \epsilon \cdot L)}]_a^b e^{(i\omega - \zeta \epsilon) \cdot \frac{1}{2}\sigma} (\sigma, -i\zeta)_b e^{-(i\omega + \zeta \epsilon) \cdot \frac{1}{2}\sigma}$ , 即  $(\sigma, -i\zeta)_a^{A'_\zeta A_\zeta}$  是常数不变张量。

自我评述：这对常数不变张量就是Penrose旋量分析 [1, 2] 的主角，这也是启示我发展一般常数不变张量理论的起因之一，在这里只是按我的方法重新发现而已。

### 3.2.4 基本定理一的推广

在任意N+1维时空中存在如下定理：（终于成功推广了）

定理3.2.2.  $[\Gamma, i\zeta]^a = [e^\vartheta]_a^b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i, \Gamma_j] + \zeta \epsilon \cdot \frac{1}{2}\Gamma} [\Gamma, i\zeta]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i, \Gamma_j] + \zeta \epsilon \cdot \frac{1}{2}\Gamma} \Leftrightarrow \{\Gamma_i, \Gamma_j\} = 2\delta_{ij}; S_{ij} := -\frac{i}{4}[\Gamma_i, \Gamma_j]$

证明：  $[\Gamma, i\zeta]^a = [e^\vartheta]_a^b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i, \Gamma_j] + \zeta \epsilon \cdot \frac{1}{2}\Gamma} [\Gamma, i\zeta]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i, \Gamma_j] + \zeta \epsilon \cdot \frac{1}{2}\Gamma}$

$\Leftrightarrow [\Gamma, i\zeta]^a = [e^\vartheta]_a^b e^{\frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma} [\Gamma, i\zeta]^b e^{-\frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma}$

$\Leftrightarrow [\Gamma, i\zeta]^a = (\delta^a_b + \vartheta^a_b)$

$[1 + \frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma][\Gamma, i\zeta]^b [1 - \frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma]$

$\Leftrightarrow 0 = \vartheta^a_b [\Gamma, i\zeta]^b$

$+ [\frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma][\Gamma, i\zeta]^a + [\Gamma, i\zeta]^a [-\frac{i}{2}\vartheta^{ij}S_{ij} + \zeta \epsilon \cdot \frac{1}{2}\Gamma]$

$\Leftrightarrow 0 = \vartheta^a_b [\Gamma, i\zeta]^b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\zeta]^a] + \frac{1}{2}\zeta\{\Gamma, i\zeta\}^a, \epsilon \cdot \Gamma\}$

$\Leftrightarrow 0 = \vartheta^{ab}[\Gamma, i\zeta]^b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\zeta]^a] + \frac{1}{2}\zeta\{\Gamma, i\zeta\}^a, \epsilon \cdot \Gamma\}$

$\Leftrightarrow \begin{cases} 0 = \vartheta^{kb}[\Gamma, i\zeta]^b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\zeta]^k] + \frac{1}{2}\zeta\{[\Gamma, i\zeta]^k, \epsilon \cdot \Gamma\} \\ 0 = \vartheta^{\pi b}[\Gamma, i\zeta]^b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\zeta]^\pi] + \frac{1}{2}\zeta\{i\zeta, \epsilon \cdot \Gamma\} \end{cases}$

$\Leftrightarrow \begin{cases} 0 = \vartheta^{kj}\Gamma_j + i\zeta\vartheta^{k\pi} + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\zeta\epsilon_l\{\Gamma^k, \Gamma^l\} \\ 0 = \vartheta^{\pi j}\Gamma_j + i\epsilon \cdot \Gamma \end{cases}$

$\Leftrightarrow \begin{cases} 0 = \vartheta^{kj}\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\zeta\epsilon_l\{\Gamma^k, \Gamma^l\} - \zeta\epsilon^k \\ 0 = 0 \end{cases}$

$\Leftrightarrow 0 = \vartheta^{ij}\delta^k_i\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\zeta\epsilon_l\{\Gamma^k, \Gamma^l\} - \zeta\epsilon^k$

$\Leftrightarrow \begin{cases} 0 = \frac{1}{2}\zeta\epsilon_l\{\Gamma^k, \Gamma^l\} - \zeta\epsilon^k \\ 0 = \vartheta^{ij}\delta^k_i\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] \end{cases}$

$\Leftrightarrow \begin{cases} 0 = \frac{1}{2}\zeta\epsilon_l\{\Gamma^k, \Gamma^l\} - \zeta\epsilon^k \\ 0 = \vartheta^{ij}\{\frac{1}{2}\delta_{k[i}\Gamma_{j]} + \frac{i}{2}[S_{ij}, \Gamma_k]\} \end{cases}$

$\Leftrightarrow \begin{cases} \{\Gamma_i, \Gamma_j\} = 2\delta_{ij} \\ i[\Gamma_k, S_{ij}] = \delta_{k[i}\Gamma_{j]} \end{cases}$

$\Leftrightarrow \{\Gamma_i, \Gamma_j\} = 2\delta_{ij}$  □

以上定理表明：反对易关系  $\{\Gamma_i, \Gamma_j\} = 2\delta_{ij}$  意味着  $(\Gamma, i\zeta)_a$  是常数不变张量，反之亦然，基本定理一只是其特殊情形而已。

### 3.2.5 常数不变张量 $[\Gamma(N), i\zeta]_{A_\zeta A'_\zeta}^a, [\Gamma(N), -i\zeta]_{A'_\zeta A_\zeta}^a$

推论3.2.3.

$\{\Gamma_i(N), \Gamma_j(N)\} = 2\delta_{ij} \Rightarrow [\Gamma(N), i\zeta]^a = [e^\vartheta]_a^b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i(N), \Gamma_j(N)] + \zeta \epsilon \cdot \frac{1}{2}\Gamma(N)} [\Gamma(N), i\zeta]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i(N), \Gamma_j(N)] + \zeta \epsilon \cdot \frac{1}{2}\Gamma(N)}$

自我评述：所以  $[\Gamma(N), i\zeta]_{A_\zeta A'_\zeta}^a$  和  $[\Gamma(N), -i\zeta]_{A'_\zeta A_\zeta}^a$  是常数不变张量，是Penrose旋量在高低维时空的推广。

## 3.3 基本定理二及其相关常数不变张量

### 3.3.1 基本定理二

定理3.3.1.  $\Gamma_{\alpha_\zeta} = [e^{(i\omega + \zeta \epsilon) \cdot \gamma}]_{\alpha_\zeta}^{\beta_\zeta} e^{(i\omega + \zeta \epsilon) \cdot \Gamma} \Gamma_{\beta_\zeta} e^{-(i\omega + \zeta \epsilon) \cdot \Gamma} \Leftrightarrow [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = i\epsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta}$

$$\begin{aligned}
& \text{证明: } \Gamma_{\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\Gamma} \Gamma_{\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\Gamma}, \forall \omega, \forall \epsilon \\
& \Leftrightarrow \Gamma_{\alpha_\zeta} = [\delta_{\alpha_\zeta}^{\beta_\zeta} + (i\omega + \zeta\epsilon) \cdot \gamma_{\alpha_\zeta}^{\beta_\zeta}] [1 + (i\omega + \zeta\epsilon) \cdot \Gamma] \Gamma_{\beta_\zeta} [1 - (i\omega + \zeta\epsilon) \cdot \Gamma], \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0 \\
& \Leftrightarrow 0 = (i\omega + \zeta\epsilon) \cdot \{\gamma_{\alpha_\zeta}^{\beta_\zeta} \Gamma_{\beta_\zeta} + [\Gamma, \Gamma_{\alpha_\zeta}]\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0 \\
& \Leftrightarrow \gamma_{\alpha_\zeta}^{\beta_\zeta} \Gamma_{\beta_\zeta} + [\Gamma, \Gamma_{\alpha_\zeta}] = 0 \\
& \Leftrightarrow \gamma_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta} + [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = 0 (\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \equiv i \gamma_{\alpha_\zeta \beta_\zeta} \gamma_\zeta) \\
& \Leftrightarrow [\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = i \varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta} \quad \square
\end{aligned}$$

以上定理表明：对易关系 $[\Gamma_{\alpha_\zeta}, \Gamma_{\beta_\zeta}] = i \varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \Gamma_{\gamma_\zeta}$ 意味着 $\Gamma_{\alpha_\zeta}$ 是常数不变张量，反之亦然。

### 3.3.2 广义基本定理二

$$\begin{aligned}
& \text{证明: } T_{\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\Gamma} T_{\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\Gamma}, \forall \omega, \forall \epsilon \\
& \Leftrightarrow T_{\alpha_\zeta} = [\delta_{\alpha_\zeta}^{\beta_\zeta} + (i\omega + \zeta\epsilon) \cdot \gamma_{\alpha_\zeta}^{\beta_\zeta}] [1 + (i\omega + \zeta\epsilon) \cdot \Gamma] T_{\beta_\zeta} [1 - (i\omega + \zeta\epsilon) \cdot \Gamma], \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0 \\
& \Leftrightarrow 0 = (i\omega + \zeta\epsilon) \cdot \{\gamma_{\alpha_\zeta}^{\beta_\zeta} T_{\beta_\zeta} + [\Gamma, T_{\alpha_\zeta}]\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0 \\
& \Leftrightarrow \gamma_{\alpha_\zeta}^{\beta_\zeta} T_{\beta_\zeta} + [\Gamma, T_{\alpha_\zeta}] = 0 \\
& \Leftrightarrow \gamma_{\alpha_\zeta \beta_\zeta} \gamma_\zeta T_{\gamma_\zeta} + [\Gamma_{\alpha_\zeta}, T_{\beta_\zeta}] = 0 (\varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta \equiv i \gamma_{\alpha_\zeta \beta_\zeta} \gamma_\zeta) \\
& \Leftrightarrow [\Gamma_{\alpha_\zeta}, T_{\beta_\zeta}] = i \varepsilon_{\alpha_\zeta \beta_\zeta} \gamma_\zeta T_{\gamma_\zeta} \quad \square
\end{aligned}$$

### 3.3.3 推广：常数不变张量算符<sup>[45]</sup>

定理3.3.3.

$$\begin{cases} \hat{T}(j, m) = \sum_{m'=j}^{-j} \langle j, m | U^+(R) | j, m' \rangle U(R) \hat{T}(j, m') U^+(R) \\ U(R) \hat{T}(j, m) U^+(R) = \sum_{m'=j}^{-j} \hat{T}(j, m') \langle j, m' | U(R) | j, m \rangle \\ U(R) | j, m \rangle = \sum_{m'=j}^{-j} | j, m' \rangle \langle j, m' | U(R) | j, m \rangle \end{cases}$$

### 3.3.4 常数不变张量 $\sigma^{\alpha_\zeta k'_\zeta l'_\zeta}(s), \sigma^{\alpha'_\zeta k'_\zeta l'_\zeta}(s), \sigma^{\alpha_\zeta A_\zeta B_\zeta}, \sigma^{\alpha'_\zeta A'_\zeta B'_\zeta}$

推论3.3.1.  $\sigma^{\alpha_\zeta}(s) = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\sigma(s)} \sigma^{\beta_\zeta}(s) e^{-(i\omega+\zeta\epsilon)\cdot\sigma(s)}$ , 即 $\sigma^{\alpha_\zeta k'_\zeta l'_\zeta}(s)$ 是常数不变张量。

推论3.3.2.  $\sigma^{\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma} \sigma^{\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma}$ , 即 $\sigma^{\alpha_\zeta A_\zeta B_\zeta}$ 是常数不变张量。

推论3.3.3.  $\sigma^{\alpha'_\zeta}(s) = [e^{(i\omega-\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta'_\zeta e^{(i\omega-\zeta\epsilon)\cdot\sigma(s)} \sigma^{\beta'_\zeta}(s) e^{-(i\omega-\zeta\epsilon)\cdot\sigma(s)}$ , 即 $\sigma^{\alpha'_\zeta k'_\zeta l'_\zeta}(s)$ 是常数不变张量。

推论3.3.4.  $\sigma^{\alpha'_\zeta} = [e^{(i\omega-\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta'_\zeta e^{(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma} \sigma^{\beta'_\zeta} e^{-(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma}$ , 即 $\sigma^{\alpha'_\zeta A'_\zeta B'_\zeta}$ 是常数不变张量。

自我评述：这个定理表明自旋矩阵是常数不变张量，结合上一节的定理，发现泡利矩阵可以组合成两类常数不变张量，这很有意思，但其它自旋矩阵没这个性质，所以泡利矩阵很特别。

推论3.3.5.  $\sigma^{\alpha'_\zeta}(s) = [e^{i\omega\cdot\gamma}]_{\alpha'_\zeta} \beta'_\zeta e^{i\omega\cdot\sigma(s)} \sigma^{\beta'_\zeta}(s) e^{-i\omega\cdot\sigma(s)} [\Rightarrow] \sigma(s) \cdot \hat{p} = e^{i\omega\cdot\sigma(s)} \sigma_z(s) e^{-i\omega\cdot\sigma(s)}$

### 3.3.5 反对称常数不变张量 $\varepsilon_{\alpha_\zeta \beta_\zeta \gamma_\zeta}, \varepsilon_{\alpha'_\zeta \beta'_\zeta \gamma'_\zeta}$

推论3.3.6.  $\gamma_{\alpha_\zeta}(s) = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\gamma} \gamma_{\beta_\zeta}(s) e^{-(i\omega+\zeta\epsilon)\cdot\gamma}$ , 即 $\varepsilon_{\alpha_\zeta \beta_\zeta \gamma_\zeta} (\equiv i \gamma_{\alpha_\zeta \beta_\zeta \gamma_\zeta})$ 是常数不变张量。

推论3.3.7.  $\gamma_{\alpha'_\zeta}(s) = [e^{(i\omega-\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta'_\zeta e^{(i\omega-\zeta\epsilon)\cdot\gamma} \gamma_{\beta'_\zeta}(s) e^{-(i\omega-\zeta\epsilon)\cdot\gamma}$ , 即 $\varepsilon_{\alpha'_\zeta \beta'_\zeta \gamma'_\zeta} (\equiv i \gamma_{\alpha'_\zeta \beta'_\zeta \gamma'_\zeta})$ 是常数不变张量。

自我评述：以上表明三维反对称张量是四维洛伦兹常数不变张量。

### 3.3.6 过渡

推论3.3.8.  $\sigma_{+\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+} \sigma_{+\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+}$

推论3.3.9.  $\sigma_{-\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-} \sigma_{-\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-}$

### 3.3.7 常数不变张量 $\sigma_{+\alpha}^{ab}, \sigma_{-\alpha'}^{ab}, \sigma_{\zeta\alpha_\zeta}^{ab}, \sigma_{-\zeta\alpha'_\zeta}^{ab}$

推论3.3.10.  $\sigma_{+\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega\cdot R+\zeta\epsilon\cdot L)} \sigma_{+\beta_\zeta} e^{-(i\omega\cdot R+\zeta\epsilon\cdot L)}$ , 即  $\sigma_{+\alpha_\zeta}^{a_\zeta b_\zeta}$  是常数不变张量。

证明:  $\sigma_{+\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+} \sigma_{+\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+}$   
 $\Leftrightarrow \sigma_{+\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+} [e^{(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma_-} \sigma_{+\beta_\zeta} e^{-(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma_-}] e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_+}$   
 $\Leftrightarrow \sigma_{+\alpha_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha_\zeta} \beta_\zeta e^{(i\omega\cdot R+\zeta\epsilon\cdot L)} \sigma_{+\beta_\zeta} e^{-(i\omega\cdot R+\zeta\epsilon\cdot L)}$ , 即  $\sigma_{+\alpha_\zeta}^{a_\zeta b_\zeta}$  是常数不变张量。  $\square$

推论3.3.11.  $\sigma_{-\alpha'_\zeta} = [e^{(i\omega-\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta'_\zeta e^{(i\omega\cdot R+\zeta\epsilon\cdot L)} \sigma_{-\beta'_\zeta} e^{-(i\omega\cdot R+\zeta\epsilon\cdot L)}$ , 即  $\sigma_{-\alpha'_\zeta}^{a_\zeta b_\zeta}$  是常数不变张量。

证明:  $\sigma_{-\alpha'_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-} \sigma_{-\beta_\zeta} e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-}$   
 $\Leftrightarrow \sigma_{-\alpha'_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta_\zeta e^{(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-} [e^{(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma_+} \sigma_{-\beta_\zeta} e^{-(i\omega-\zeta\epsilon)\cdot\frac{1}{2}\sigma_+}] e^{-(i\omega+\zeta\epsilon)\cdot\frac{1}{2}\sigma_-}$   
 $\Leftrightarrow \sigma_{-\alpha'_\zeta} = [e^{(i\omega+\zeta\epsilon)\cdot\gamma}]_{\alpha'_\zeta} \beta_\zeta e^{(i\omega\cdot R-\zeta\epsilon\cdot L)} \sigma_{-\beta_\zeta} e^{-(i\omega\cdot R-\zeta\epsilon\cdot L)}$ , 即  $\sigma_{-\alpha'_\zeta}^{a_\zeta b_\zeta}$  是常数不变张量。  $\square$

综合  $\sigma_{+\alpha_\zeta}^{a_\zeta b_\zeta}, \sigma_{-\alpha'_\zeta}^{a_\zeta b_\zeta}$  两者可知:  $\sigma_{+\alpha}^{ab}, \sigma_{-\alpha'}^{ab}$  是常数不变张量, 进一步可知:  $\sigma_{\zeta\alpha_\zeta}^{ab}, \sigma_{-\zeta\alpha'_\zeta}^{ab}$  是常数不变张量。

自我评述: 以上严格证明了SO(4)两个生成元矩阵是常数不变张量。

### 3.3.8 基本定理二推广形式

引理3.3.1.  $[\Gamma_i, \Gamma_j] = -2\gamma^k_{ij} \Gamma_k \Rightarrow [\gamma_i, \gamma_j] = -\gamma^k_{ij} \gamma_k$

定理3.3.4.  $\Gamma_{\alpha_\zeta} = [e^{\frac{i}{2}\omega^{ij} \vec{S}_{ij} + \zeta\epsilon^k \gamma_k}]_{\alpha_\zeta} \beta_\zeta e^{\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k} \Gamma_{\beta_\zeta} e^{-(\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k)}$

$\Leftrightarrow [\Gamma_i, \Gamma_j] = -2\gamma^k_{ij} \Gamma_k, \frac{1}{4}[[\Gamma_i, \Gamma_j], \Gamma_k] = -i[\vec{S}_{ij}]_k^l \Gamma_l$

证明:  $\Gamma_{\alpha_\zeta} = [e^{\frac{i}{2}\omega^{ij} \vec{S}_{ij} + \zeta\epsilon^k \gamma_k}]_{\alpha_\zeta} \beta_\zeta e^{\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k} \Gamma_{\beta_\zeta} e^{-(\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k)}, \forall \omega, \forall \epsilon$   
 $\Leftrightarrow \Gamma_{\alpha_\zeta} = [\delta_{\alpha_\zeta}^{\beta_\zeta} + (\frac{i}{2}\omega^{ij} \vec{S}_{ij} + \zeta\epsilon^k \gamma_k)_{\alpha_\zeta}^{\beta_\zeta}] [1 + \frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k] \Gamma_{\beta_\zeta} [1 - \frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] - \frac{1}{2}\zeta\epsilon^k \Gamma_k], \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$   
 $\Leftrightarrow 0 = (\frac{i}{2}\omega^{ij} \vec{S}_{ij} + \zeta\epsilon^k \gamma_k)_{\alpha_\zeta}^{\beta_\zeta} \Gamma_{\beta_\zeta} + [\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j] + \frac{1}{2}\zeta\epsilon^k \Gamma_k, \Gamma_{\alpha_\zeta}], \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$   
 $\Leftrightarrow 0 = \epsilon^k \gamma_k \alpha_\zeta^{\beta_\zeta} \Gamma_{\beta_\zeta} + [\epsilon^k \Gamma_k, \Gamma_{\alpha_\zeta}], 0 = \frac{i}{2}\omega^{ij} [\vec{S}_{ij}]_{\alpha_\zeta}^{\beta_\zeta} \Gamma_{\beta_\zeta} + [\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j], \Gamma_{\alpha_\zeta}]$   
 $\Leftrightarrow [\Gamma_k, \Gamma_{\alpha_\zeta}] = -2\gamma_k \alpha_\zeta^{\beta_\zeta} \Gamma_{\beta_\zeta}, \frac{1}{4}[[\Gamma_i, \Gamma_j], \Gamma_{\alpha_\zeta}] = -i[\vec{S}_{ij}]_{\alpha_\zeta}^{\beta_\zeta} \Gamma_{\beta_\zeta}$   
 $\Leftrightarrow [\Gamma_i, \Gamma_j] = -2\gamma^k_{ij} \Gamma_k, \frac{1}{4}[[\Gamma_i, \Gamma_j], \Gamma_k] = -i[\vec{S}_{ij}]_k^l \Gamma_l$   
 $\Leftrightarrow [\Gamma_i, \Gamma_j] = -2\gamma^k_{ij} \Gamma_k, \frac{1}{4}[[\Gamma_i, \Gamma_j], \Gamma_k] = \gamma^m_{ij} \gamma^l_{mk} \Gamma_l = \gamma_{ij}^m \gamma_{mk}^l \Gamma_l = -i[\vec{S}_{ij}]_k^l \Gamma_l$   $\square$

以上  $\gamma^k_{ij}$  是四维类似物,  $\vec{S}_{ij}$  一般与  $[\Gamma_i, \Gamma_j]$  不直接相关。似乎无法推广, 只有四维情形才满足。

推论3.3.12.  $\Gamma_{\alpha_\zeta} = [e^{\frac{i}{2}\omega^{ij} \vec{S}_{ij}}]_{\alpha_\zeta} \beta_\zeta e^{\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j]} \Gamma_{\beta_\zeta} e^{-\frac{1}{8}\omega^{ij} [\Gamma_i, \Gamma_j]} \Leftrightarrow \frac{1}{4}[[\Gamma_i, \Gamma_j], \Gamma_k] = -i[\vec{S}_{ij}]_k^l \Gamma_l$

## 3.4 基本定理三及其相关常数不变张量

### 3.4.1 基本定理三

在任意N+1维时空中存在如下定理:

定理3.4.1.  $\Gamma_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef} \Gamma_{ef}} \Gamma_{cd} e^{-\frac{i}{2}\vartheta^{ef} \Gamma_{ef}}, \vartheta_{ab} = -\vartheta_{ba}$

$\Leftrightarrow i[\Gamma_{ab}, \Gamma_{cd}] = \delta_{ad} \Gamma_{bc} - \delta_{ac} \Gamma_{bd} + \delta_{bc} \Gamma_{ad} - \delta_{bd} \Gamma_{ac}$

证明:  $\Gamma_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef} \Gamma_{ef}} \Gamma_{cd} e^{-\frac{i}{2}\vartheta^{ef} \Gamma_{ef}}, \forall \vartheta^{ef}$   
 $\Leftrightarrow \Gamma_{ab} = [\delta_a^c + \vartheta_a^c] [\delta_b^d + \vartheta_b^d] (1 + \frac{i}{2}\vartheta^{ef} \Gamma_{ef}) \Gamma_{cd} (1 - \frac{i}{2}\vartheta^{ef} \Gamma_{ef}), \forall \vartheta^{ef} \rightarrow 0$   
 $\Leftrightarrow 0 = \vartheta_a^c \Gamma_{cb} - \vartheta_b^d \Gamma_{da} - \frac{i}{2}\vartheta^{cd} [\Gamma_{ab}, \Gamma_{cd}], \forall \vartheta^{cd} \rightarrow 0$   
 $\Leftrightarrow i\vartheta^{cd} [\Gamma_{ab}, \Gamma_{cd}] = 2(\vartheta_a^c \Gamma_{cb} - \vartheta_b^d \Gamma_{da}), \forall \vartheta^{cd} \rightarrow 0$   
 $\Leftrightarrow i\vartheta^{cd} [\Gamma_{ab}, \Gamma_{cd}] = \vartheta^{cd} (\delta_{ad} \Gamma_{bc} - \delta_{ac} \Gamma_{bd} + \delta_{bc} \Gamma_{ad} - \delta_{bd} \Gamma_{ac}), \forall \vartheta^{cd} \rightarrow 0$   
 $\Leftrightarrow i[\Gamma_{ab}, \Gamma_{cd}] = \delta_{ad} \Gamma_{bc} - \delta_{ac} \Gamma_{bd} + \delta_{bc} \Gamma_{ad} - \delta_{bd} \Gamma_{ac}$   $\square$

以上定理表明: 对易关系  $i[\Gamma_{ab}, \Gamma_{cd}] = \delta_{ad} \Gamma_{bc} - \delta_{ac} \Gamma_{bd} + \delta_{bc} \Gamma_{ad} - \delta_{bd} \Gamma_{ac}$  意味着  $\Gamma_{ab}$  是常数不变张量, 反之亦然。

$$\Leftrightarrow 0 = \vartheta_a^c T_{cb} + \vartheta_b^d T_{ad} - \frac{i}{2}\vartheta^{cd}[T_{ab}, \Gamma_{cd}], \forall \vartheta^{cd} \rightarrow 0$$

$$\Leftrightarrow i\vartheta^{cd}[T_{ab}, \Gamma_{cd}] = 2(\vartheta_a^c T_{cb} + \vartheta_b^d T_{ad}), \forall \vartheta^{cd} \rightarrow 0$$

$$\Leftrightarrow i\vartheta^{cd}[T_{ab}, \Gamma_{cd}] = 2\vartheta^{cd}(-\delta_{ad} T_{cb} + \delta_{bc} T_{ad}), \forall \vartheta^{cd} \rightarrow 0$$

$$\Leftrightarrow i[T_{ab}, \Gamma_{cd}] = \delta_{ac} T_{db} - \delta_{ad} T_{cb} + \delta_{bc} T_{ad} - \delta_{bd} T_{ac} \quad \square$$

### 3.4.3 自旋常数不变张量<sup>[9]</sup> $S_{abA}^B$

推论3.4.1.  $S_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}S_{ef}} S_{cd} e^{-\frac{i}{2}\vartheta^{ef}S_{ef}}$ , 即  $S_{abA}^B$  是常数不变张量。

自我评述：以上表明在任意时空中物理的自旋张量都是常数不变张量。

### 3.4.4 自旋常数不变张量 $S_{abk_\zeta}^{l_\zeta}(s, \zeta), S_{ab}^{k'_\zeta l'_\zeta}(s, -\zeta)$

推论3.4.2.  $S_{ab}(s, \zeta) = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}S_{ef}(s, \zeta)} S_{cd}(s, \zeta) e^{-\frac{i}{2}\vartheta^{ef}S_{ef}(s, \zeta)}$ , 即  $S_{abk_\zeta}^{l_\zeta}(s, \zeta)$  是常数不变张量。

推论3.4.3.  $S_{ab}(s, -\zeta) = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}S_{ef}(s, -\zeta)} S_{cd}(s, -\zeta) e^{-\frac{i}{2}\vartheta^{ef}S_{ef}(s, -\zeta)}$ , 即  $S_{ab}^{k'_\zeta l'_\zeta}(s, -\zeta)$  是常数不变张量。

### 3.4.5 自旋常数不变张量 $S_{abA_\zeta}^{B_\zeta}(\frac{1}{2}, \zeta), S_{ab}^{A'_\zeta B'_\zeta}(\frac{1}{2}, -\zeta)$

上节取  $s = \frac{1}{2}$  可得：  $S_{abA_\zeta}^{B_\zeta}(\frac{1}{2}, \zeta), S_{ab}^{A'_\zeta B'_\zeta}(\frac{1}{2}, -\zeta)$  是常数不变张量。

## 3.5 基本定理四及其相关常数不变张量

### 3.5.1 基本定理四

引理3.5.1.  $[\Gamma_a, [\Gamma_c, \Gamma_d]] = \frac{1}{2}(\{\{\Gamma_a, \Gamma_c\}, \Gamma_d\} - \{\Gamma_c, \{\Gamma_d, \Gamma_a\}\})$

在任意N+1维时空中存在如下定理：

### 3.5.2 $n = N + 1$ 维时空中的常数不变张量 $\Gamma_{\lambda_c}^{\mu_c}(n)$

引理3.5.2.  $\{\Gamma_a, \Gamma_b\} = 2\delta_{ab} \Rightarrow \frac{1}{4}[\Gamma_a, [\Gamma_c, \Gamma_d]] = \delta_{a[c}\Gamma_{d]}$

在任意 $N+1$ 维时空中存在如下定理：

定理3.5.3.  $\{\Gamma_a, \Gamma_b\} = 2\delta_{ab} \Rightarrow \Gamma_a = [e^{\vartheta}]_a^b e^{\frac{i}{2}\vartheta^{cd}S_{cd}}\Gamma_b e^{-\frac{i}{2}\vartheta^{cd}S_{cd}}, S_{cd} = -\frac{i}{4}[\Gamma_c, \Gamma_d]$

自我评述：在任意 $N+1$ 维时空中Dirac矩阵 $\Gamma_a$ 和 $\Gamma_{N+1}, \Gamma_{N+2}$ 是常数不变张量。

### 3.5.3 常数不变张量<sup>[5]</sup> $\gamma_{a\lambda_c}^{\mu_c}(\varsigma), \gamma_{5\lambda_c}^{\mu_c}(\varsigma), \delta_{\lambda_c}^{\mu_c}, \gamma_4^{\lambda_c\lambda_c}$

定义3.5.1.  $\gamma_5(\varsigma) \equiv \gamma_x(\varsigma)\gamma_y(\varsigma)\gamma_z(\varsigma)\gamma_\pi(\varsigma), S_{ab}(e, \varsigma) \equiv -\frac{i}{4}[\gamma_a(\varsigma), \gamma_b(\varsigma)]$

定义3.5.2.  $\lambda_c \sim e^{\frac{i}{2}\vartheta^{ab}S_{ab}(e, \varsigma)}, \mu_c \sim e^{-\frac{i}{2}\vartheta^{ab}S_{ab}^T(e, \varsigma)}$

定义3.5.3. 一个特殊表象： $\langle \gamma_a(\varsigma), \gamma_5(\varsigma) \rangle = [(\sigma \otimes \sigma_y, \varsigma I \otimes \sigma_x), \varsigma I \otimes \sigma_z]$

推论3.5.2.  $\gamma_a(\varsigma) = [e^{\vartheta}]_a^b e^{\frac{i}{2}\vartheta^{cd}S_{cd}(e, \varsigma)}\gamma_b(\varsigma)e^{-\frac{i}{2}\vartheta^{cd}S_{cd}(e, \varsigma)}$ , 即 $\gamma_{a\lambda_c}^{\mu_c}(\varsigma)$ 是常数不变张量。

推论3.5.3.  $\gamma_5(\varsigma) = e^{\frac{i}{2}\vartheta^{ab}S_{ab}(e, \varsigma)}\gamma_5(\varsigma)e^{-\frac{i}{2}\vartheta^{ab}S_{ab}(e, \varsigma)}$ , 即 $\gamma_{5\lambda_c}^{\mu_c}(\varsigma)$ 是常数不变张量。

推论3.5.4.  $I_4 = e^{\frac{i}{2}\vartheta^{ab}S_{ab}(e, \varsigma)}I_4e^{-\frac{i}{2}\vartheta^{ab}S_{ab}(e, \varsigma)}$ , 即 $\delta_{\lambda_c}^{\mu_c}$ 是常数不变张量。

推论3.5.5.  $\gamma_4 = e^{\frac{i}{2}\vartheta^{*ab}S_{ab}(e, \varsigma)}\gamma_4e^{-\frac{i}{2}\vartheta^{*ab}S_{ab}(e, \varsigma)}$ , 即 $\gamma_4^{\lambda_c\lambda_c}$ 是常数不变张量。

自我评述：以上表明四维时空中Dirac矩阵和 $\gamma_4, \gamma_5$ 矩阵都是常数不变张量。

## 3.6 基本定理五及其相关常数不变张量

### 3.6.1 基本定理五

定理3.6.1.  $T_\alpha = [e^{\theta^\gamma f_\gamma}]_\alpha^\beta e^{i\theta^\gamma T_\gamma} T_\beta e^{-i\theta^\gamma T_\gamma} \Leftrightarrow [T_\alpha, T_\beta] = i f_{\alpha\beta}{}^\gamma T_\gamma, f_\alpha \prec f_{\alpha\beta}{}^\gamma$

证明： $T_\alpha = [e^{\theta^\gamma f_\gamma}]_\alpha^\beta e^{i\theta^\gamma T_\gamma} T_\beta e^{-i\theta^\gamma T_\gamma}, \forall \theta^\gamma$

$\Leftrightarrow T_\alpha = (\delta_\alpha^\beta + \theta^\gamma f_{\gamma\alpha}{}^\beta)(1 + i\theta^\gamma T_\gamma) T_\beta (1 - i\theta^\gamma T_\gamma), \forall \theta^\gamma \rightarrow 0$

$\Leftrightarrow 0 = \theta^\gamma (f_{\gamma\alpha}{}^\beta T_\beta + i[T_\gamma, T_\alpha]), \forall \theta^\gamma \rightarrow 0$

$\Leftrightarrow 0 = f_{\gamma\alpha}{}^\beta T_\beta + i[T_\gamma, T_\alpha]$

$\Leftrightarrow [T_\alpha, T_\beta] = i f_{\alpha\beta}{}^\gamma T_\gamma$  □

以上定理表明：对易关系 $[T_\alpha, T_\beta] = i f_{\alpha\beta}{}^\gamma T_\gamma$ 意味着Yang-Mills基 $T_\alpha$ 是常数不变张量，反之亦然。并且基本定理二是本定理的特殊情形( $f_{\alpha\beta}{}^\gamma = \varepsilon_{\alpha\beta}{}^\gamma, i\theta^\gamma = i\omega + \varsigma\epsilon, T_\alpha = \Gamma_\alpha$ )，此定理更为广泛一般，可以描述内部空间和外部空间的协变性，并且对 $T_\alpha$ 的线性无关性没有要求。如果 $T_\alpha$ 满足线性无关性，则由群的结构方程可知群结构常数 $f_{\alpha\beta}{}^\gamma$ 也满足类似Yang-Mills基 $T_\alpha$ 的对易关系，即有如下推论：

推论3.6.1.  $[-if_\alpha, -if_\beta] = if_{\alpha\beta}{}^\gamma(-if_\gamma) \Leftrightarrow -if_\alpha = [e^{\theta^\gamma f_\gamma}]_\alpha^\beta e^{i\theta^\gamma(-if_\gamma)}(-if_\beta)e^{-i\theta^\gamma(-if_\gamma)}$

上式左侧就是群的结构方程，所以如果基 $T_\alpha$ 满足线性无关性，则群结构常数 $f_{\alpha\beta}{}^\gamma$ 也是常数不变张量。

自我评述：以上表明Yang-Mills基和群结构常数是内部空间的常数不变张量。

### 3.7 基本定理六及其相关常数不变张量

#### 3.7.1 基本定理六

定理3.7.1.  $\Gamma = e^{(i\omega \cdot R + \zeta \epsilon \cdot L)} \Gamma e^{-(i\omega \cdot R - \zeta \epsilon \cdot L)} \Leftrightarrow [R, \Gamma] = 0, \{L, \Gamma\} = 0$

证明:  $\Gamma = e^{(i\omega \cdot R + \zeta \epsilon \cdot L)} \Gamma e^{-(i\omega \cdot R - \zeta \epsilon \cdot L)}, \forall \omega, \forall \epsilon$

$\Leftrightarrow \Gamma = [1 + (i\omega \cdot R + \zeta \epsilon \cdot L)] \Gamma [1 - (i\omega \cdot R - \zeta \epsilon \cdot L)], \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow 0 = (i\omega \cdot R + \zeta \epsilon \cdot L) \Gamma - \Gamma (i\omega \cdot R - \zeta \epsilon \cdot L), \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow 0 = i\omega \cdot [R, \Gamma] + \zeta \epsilon \cdot \{L, \Gamma\}, \forall \omega \rightarrow 0, \forall \epsilon \rightarrow 0$

$\Leftrightarrow [R, \Gamma] = 0, \{L, \Gamma\} = 0$  □

推论3.7.1.  $\eta = e^{(i\omega \cdot R + \zeta \epsilon \cdot L)} \eta e^{-(i\omega \cdot R - \zeta \epsilon \cdot L)}, \eta = \text{diag}(1, 1, 1, -1)$ , 即  $\eta^{a_\zeta b'_\zeta}, \eta^{a'_\zeta b}, \eta^{a b'}, \eta^{a' b}$  是常数不变张量。

自我评述: 这个常数不变张量可以完成矢量与带撇矢量之间的相互转换, 形式上与闵斯科夫度规一样。

### 3.8 新常数不变张量的各种获得方法

方法一:  $\epsilon \leftrightarrow -\epsilon$

方法二:  $\zeta \leftrightarrow -\zeta$

方法三: 取复共轭、转置、相似变换、表象变换等矩阵操作

方法四: 取直积、直和、缩并、加减乘除等运算

另外在六个基本定理的各种推论中已运用了以上方法得到了各种常数不变张量, 各种推论的证明基本上是显而易见的, 并且为了内容的紧凑性, 大多略去了其证明过程。

### 3.9 对六个基本定理的评述

六个基本定理的数学证明过程中对变换参数  $\omega, \epsilon, \vartheta^{ab}, \theta^\alpha$  无特别的限制, 可以取任意复数, 所以得到的常数不变张量具有很大的数学广泛性。但对于具体物理来讲, 内部规范变换的各种参数仍可以取复数。然而对于外部时空变换, 由于物理上自治性要求, 变换必须满足洛伦兹群表示<sup>[13]</sup>, 所以对变换矩阵和变换参数有限制, 且  $\omega, \epsilon$  只能取实数。特别需要指出的是, 基本定理一的推广形式、基本定理三和基本定理四不光在四维时空中成立, 而且在任意  $N+1$  维时空中也成立, 这样为高低维时空的物理研究提供了一个数学分析工具。从六个基本定理的证明还可以得到如下启示: 矩阵的对易和反对易关系意味着存在对应的常数不变张量, 反之, 某种常数不变张量意味着存在相应的对易和反对易关系, 从这个思路出发可以去寻找更多有意义的常数不变张量。从上还可以知道矩阵的对易和反对易关系意味着其自身的协变性, 即该矩阵的对易和反对易关系本身隐含了其在任何参考系中均成立, 这是一个很有趣很奇妙的自举数学性质, 令人回味无穷。

## 5.6 矢量自旋张量 $S_{abcd}$ 和反对称张量 $\varepsilon_{abcd}$ 的性质

定理5.6.1.  $S_{abcd} = -\frac{1}{2}(\sigma_{-ab}^{\alpha'_\zeta} \sigma_{-\alpha'cd} + \sigma_{+ab}^{\alpha'_\zeta} \sigma_{+\alpha cd}) = \delta_{ac} \delta_{bd} - \delta_{ad} \delta_{bc} = \delta_{a[c} \delta_{d]b} = \delta_{c[a} \delta_{b]d}$ ,  $\vec{S}_{ab} := -i S_{ab|cd}$

定理5.6.2.  $\varepsilon_{abcd} = -\frac{1}{2}(\sigma_{-ab}^{\alpha'_\zeta} \sigma_{-\alpha'cd} - \sigma_{+ab}^{\alpha'_\zeta} \sigma_{+\alpha cd})$

对以上两个定理分情况展开即可证明，这两个定理是以下一些推论的基础与前提。

结合(1.235), (1.259), (1.260)式可得Penrose对应记法：

推论5.6.1.  $S_{abcd} \stackrel{P}{=} \varepsilon_{AC} \varepsilon_{BD} \varepsilon_{A'C'} \varepsilon_{B'D'} - \varepsilon_{AD} \varepsilon_{BC} \varepsilon_{A'D'} \varepsilon_{B'C'}$

推论5.6.2.  $\varepsilon_{abcd} = -\varepsilon_{acbd} \stackrel{P}{=} \varepsilon_{AC} \varepsilon_{BD} \varepsilon_{A'D'} \varepsilon_{B'C'} - \varepsilon_{AD} \varepsilon_{BC} \varepsilon_{A'C'} \varepsilon_{B'D'}$

$$\begin{cases} S_{(*ab)(*cd)} = S_{abcd} & \begin{cases} S_{(*ab)cd} = S_{ab(*cd)} = \varepsilon_{abcd} \\ \varepsilon_{(*ab)(*cd)} = \varepsilon_{abcd} & \begin{cases} \varepsilon_{(*ab)cd} = \varepsilon_{ab(*cd)} = S_{abcd} \end{cases} \end{cases} \end{cases} \quad (1.155)$$

$$S_{abcd} = S_{cdab}, S_{abcd} = -S_{bacd}, S_{abcd} = S_{abdc}, S_{abcd} = \frac{1}{2} S_{abef} S^{ef}{}_{cd}, \vartheta_{ab} = \frac{1}{2} S_{abcd} \vartheta^{cd} \quad (1.156)$$

$$\begin{cases} \sigma_{-ab}^{\alpha'_\zeta} \sigma_{-\alpha'cd} = -(S_{abcd} + \varepsilon_{abcd}) = (-\delta_{ac} \delta_{bd} + \delta_{ad} \delta_{bc} - \varepsilon_{abcd}) \\ \sigma_{+ab}^{\alpha'_\zeta} \sigma_{+\alpha cd} = -(S_{abcd} - \varepsilon_{abcd}) = (-\delta_{ac} \delta_{bd} + \delta_{ad} \delta_{bc} + \varepsilon_{abcd}) \end{cases} \quad (1.157)$$

$$\sigma_{s ab}^{\alpha_\zeta} \sigma_{s \alpha_\zeta cd} = -(S_{abcd} - \varsigma \varepsilon_{abcd}) = (-\delta_{ac} \delta_{bd} + \delta_{ad} \delta_{bc} + \varsigma \varepsilon_{abcd}) \quad (1.158)$$

推论5.6.3.  $\sigma_{s ab}^{\alpha_\zeta} \sigma_{-s \alpha_\zeta cd} = -\eta_{ac} \eta_{bd} + \eta_{ad} \eta_{bc} + \varsigma \varepsilon_{abc'd'} \eta_c{}^{c'} \eta_d{}^{d'}$

证明： $\sigma_{s ab}^{\alpha_\zeta} \sigma_{-s \alpha_\zeta cd}$   
 $= \sigma_{s ab}^{\alpha_\zeta} \sigma_{s \alpha_\zeta c'd'} \eta_c{}^{c'} \eta_d{}^{d'}$   
 $= -(S_{abc'd'} - \varsigma \varepsilon_{abc'd'}) \eta_c{}^{c'} \eta_d{}^{d'}$

$$\begin{aligned}
&= (-\delta_{ac'}\delta_{bd'} + \delta_{ad'}\delta_{bc'} + \varsigma\varepsilon_{abc'd'})\eta_c^{c'}\eta_d^{d'} \\
&= -\eta_{ac}\eta_{bd} + \eta_{ad}\eta_{bc} + \varsigma\varepsilon_{abc'd'}\eta_c^{c'}\eta_d^{d'}
\end{aligned}$$

## 6.8 复合常数不变张量 $\Sigma_{k_s l_{s'}}^{k_s l_s}(s, s')$ 的性质

### 6.8.1 定义

$$c(s) = [(-1)^{2s} \frac{8}{3} s(s + \frac{1}{2})(s + 1)]^{-\frac{1}{2}} \quad (1.276)$$

$$\Sigma_{ab}^{k_s l_s}(s) := \begin{cases} c(|s|) S_{ab}^{kl}(|s|, +), & s > 0 \\ c(|s|) S_{abk'l'}(|s|, -), & s < 0 \end{cases} \quad \Sigma_{k_s l_s}^{ab}(s) := \begin{cases} c(|s|) S^{ab}_{kl}(|s|, +), & s > 0 \\ c(|s|) S^{abk'l'}(|s|, -), & s < 0 \end{cases} \quad (1.277)$$

$$\text{定义: } \Sigma_{k_s l_{s'}}^{k_s l_s}(s, s') := \Sigma_{ab}^{k_s l_s}(s) \Sigma_{k_s' l_{s'}}^{ab}(s') \quad (1.278)$$

### 6.8.2 传递性

$$\Sigma_{k_s l_{s'}}^{k_s l_s}(s, s') \Sigma_{k_s'' l_{s''}}^{k_s' l_{s'}}(s', s'') = \Sigma_{k_s'' l_{s''}}^{k_s l_s}(s, s'') \quad (1.279)$$

### 6.8.3 对称性与反对称性

$$\Sigma_{k_s l_{s'}}^{k_s l_s}(s, s') = (-1)^{2s+1} \Sigma_{k_s' l_{s'}}^{l_s k_s}(s, s') \quad \Sigma_{k_s l_{s'}}^{l_s k_s}(s, s') = (-1)^{2s'+1} \Sigma_{l_{s'} k_{s'}}^{k_s l_s}(s, s') \quad (1.280)$$

$$\Sigma_{k_s l_{s'}}^{k_s l_s}(s, s') = (-1)^{2(s+s')} \Sigma_{l_{s'} k_{s'}}^{l_s k_s}(s, s') \quad (1.281)$$

## 7 常数不变张量的一般理论

### 7.1 常数不变张量的一般定义

定义洛伦兹变换： $\Lambda[L_i] := e^{\frac{i}{2}\vartheta^{ab}S_{ab}[L_i]}$ , 定义YM场变换： $\Lambda[Y_j] := e^{i\theta^\alpha T_\alpha[Y_j]}$  (1.282)

常数不变张量的一般定义：

在任何参考系中 $C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m}$ 是常数并且相等，并满足如下变换：

$$C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m} = \prod_{i=1}^n \Lambda_{L_i}^{L'_i}[L_i] \prod_{j=1}^m \Lambda_{Y_j}^{Y'_j}[Y_j] C_{L'_1 L'_2 \dots L'_n}^{Y'_1 Y'_2 \dots Y'_m} \quad (1.283)$$

则 $C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m}$ 是常数不变张量,  $L_i \sim e^{\frac{i}{2}\vartheta^{ab}S_{ab}[L_i]}$ ,  $Y_j \sim e^{i\theta^\alpha T_\alpha[Y_j]}$

无穷小变换

$$0 = \delta C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m} = \frac{1}{2}\vartheta^{ab} \sum_{i=1}^n S_{ab L_i}^{L'_i}[L_i] C_{L_1 L_2 \dots L'_i \dots L_n}^{Y_1 Y_2 \dots Y_m} + i\theta^\alpha \sum_{j=1}^m T_{\alpha Y'_j}^{Y_j}[L_i] C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y'_j \dots Y_m}, \forall \vartheta^{ab}, \forall \theta^\alpha \quad (1.284)$$

$$\Leftrightarrow \sum_{i=1}^n S_{ab L_i}^{L'_i}[L_i] C_{L_1 L_2 \dots L'_i \dots L_n}^{Y_1 Y_2 \dots Y_m} = 0, \sum_{j=1}^m T_{\alpha Y'_j}^{Y_j}[L_i] C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y'_j \dots Y_m} = 0 \quad (1.285)$$

### 7.2 常数不变张量的协变导数为零

$$D_u C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m} = \partial_u C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m} + \frac{1}{2}\omega_u^{ab} \sum_{i=1}^n S_{ab L_i}^{L'_i}[L_i] C_{L_1 \dots L'_i \dots L_n}^{Y_1 Y_2 \dots Y_m} + iA_u^\alpha \sum_{j=1}^m T_{\alpha Y'_j}^{Y_j}[L_i] C_{L_1 L_2 \dots L_n}^{Y_1 \dots Y'_j \dots Y_m} \quad (1.286)$$

$$D_u C_{L_1 L_2 \dots L_n}^{Y_1 Y_2 \dots Y_m} = 0 + 0 + 0 = 0 \quad (1.287)$$

因此所有常数不变张量的协变导数全为零，这是一个很好、很方便的性质。

## 第二章 完美常数不变张量

自我评述：本章创立的完美常数不变张量，具有一些完美的性质，有很大的广泛性，适用于多种情形。它将全对称的低自旋张量与高自旋量联系起来，是研究一般自旋粒子的一个有力数学工具。我是受全反对称张量的启发，去尝试寻找一个类似的全对称张量，经过不断尝试，最后就找到了这样一个全对称旋量张量。然后结合上一章得到的各种基本常数不变张量，进一步发展得到了多个有用的特殊常数不变张量。

### 1 $w + 1$ 阶对称指标正向排序规律

#### 1.1 $w + 1$ 阶对称指标正向排序规律的严格证明(本质上用了数学归纳法，从0排起)

定义1.1.1.  $\lambda_i = \{0, 1, 2, \dots, w\}, 1 \leq i \leq 2s = w + 1; \lambda_{2s+1} := 0, \lambda_0 := 0$

定理1.1.1.  $\pi(\lambda_{2s} \leq \lambda_{2s-1} \leq \dots \leq \lambda_1; w) = \sum_{l=0}^{2s-1} (C_{l+1+w-\lambda_{l+2}}^{l+1} - C_{l+1+w-\lambda_{l+1}}^{l+1}) = \sum_{l=1}^{2s} (C_{l+w-\lambda_{l+1}}^l - C_{l+w-\lambda_l}^l)$

$$\begin{aligned}
 \text{证明: } \pi(\lambda_{2s} \leq \lambda_{2s-1} \leq \dots \leq \lambda_1; w) &= \pi(\lambda_{2s-1} \leq \lambda_{2s} \leq \lambda_{2s-2} \leq \lambda_{2s-1}; w - \lambda_{2s}) + \sum_{k=0}^{\lambda_{2s}-1} C_{2s-1+w-k}^{2s-1} \\
 &= \pi(\lambda_{2s-2} \leq \lambda_{2s-1} \leq \lambda_{2s-2}; w - \lambda_{2s-1}) + \sum_{k=0}^{\lambda_{2s}-1} C_{2s-1+w-k}^{2s-1} + \sum_{k=0}^{\lambda_{2s-1}-\lambda_{2s}-1} C_{2s-2+w-\lambda_{2s}-k}^{2s-2} \\

 \end{aligned}$$

证明:  $\pi(w w \cdots w; w)$

## 2 完美常数不变张量 $\Gamma_{A_\zeta B_\zeta C_\zeta \cdots}^{k_\zeta}(s; w)$ , $\Gamma_{k_\zeta}^{A_\zeta B_\zeta C_\zeta \cdots}(s; w)$

自我评述：以上表明  $\Gamma_{A_\zeta B_\zeta C_\zeta \cdots}^{k_\zeta}(s; w)$ ,  $\Gamma_{k_\zeta}^{A_\zeta B_\zeta C_\zeta \cdots}(s; w)$  是常数不变张量  $\Gamma_{A_\zeta B_\zeta C_\zeta \cdots}^{k_\zeta}(s)$ ,  $\Gamma_{k_\zeta}^{A_\zeta B_\zeta C_\zeta \cdots}(s)$  的推广。

### 2.3 定义的解读

上述定义本质上是对所有  $0_{\zeta} \cdot \cdot 0_{\zeta} \underbrace{1_{\zeta} \cdot \cdot 1_{\zeta}}_{l_1} \cdot \cdot \underbrace{w_{\zeta} \cdot \cdot w_{\zeta}}_{l_w}$  先进行排序编号。然后对每一个  $\underbrace{A_{\zeta} B_{\zeta} C_{\zeta} \cdot \cdot}_{2s}$  赋值，即先排成  $0_{\zeta} \cdot \cdot 0_{\zeta} \underbrace{1_{\zeta} \cdot \cdot 1_{\zeta}}_{l_1} \cdot \cdot \underbrace{w_{\zeta} \cdot \cdot w_{\zeta}}_{l_w}$  的形式，并与之前所有编号进行对比，如果与编号不一致的为零；与编号一致的不为零，并归一化，归一化系数是  $0_{\zeta} \cdot \cdot 0_{\zeta} \underbrace{1_{\zeta} \cdot \cdot 1_{\zeta}}_{l_1} \cdot \cdot \underbrace{w_{\zeta} \cdot \cdot w_{\zeta}}_{l_w}$  全对称化后所有种类数的倒数开方。以上常数不变张量只与旋量全对称代数性质相关，与旋量变换性质无直接相关，是全对称性张量内在固有的代数性质，与  $A_{\zeta}$  指标阶数直接本质相关。

### 2.4 常数矩阵 $\Gamma(s; w)$ , $\bar{\Gamma}(s; w)$ 的引入

## 2.26 两个定理的另外一种证明方法(强调思路启发而不求全)

**定理2.26.1.**  $\Omega(s)\Gamma(s) = \Gamma(s)\sigma(s), \bar{\Gamma}(s)\Omega(s) = \sigma(s)\bar{\Gamma}(s)$

**证明:** 采用数学归纳法

1: 当  $s = \frac{1}{2}$  时,  $\sigma(\frac{1}{2})\Gamma(\frac{1}{2}) = \Gamma(\frac{1}{2})\sigma(\frac{1}{2})$  成立。

2: 假设  $s = k$  时,  $\Omega(k)\Gamma(k) = \Gamma(k)\sigma(k)$  成立。

3: 当  $s = k + \frac{1}{2}$  时

$$\begin{aligned}
& \Omega(k + \frac{1}{2})\Gamma(k + \frac{1}{2}) \\
& = [\sigma(\frac{1}{2}) \otimes I_{2^{2k}} + I \otimes \Omega(k)][I \otimes \Gamma(k)]N(k + \frac{1}{2}) \\
& = \{[I \otimes \Gamma(k)][\sigma(\frac{1}{2}) \otimes I_{2^{(k+1)}}] + I \otimes [\Gamma(k)\sigma(k)]\}N(k + \frac{1}{2}) \\
& = [I \otimes \Gamma(k)][\sigma(\frac{1}{2}) \otimes I_{2^{(k+1)}} + I \otimes \sigma(k)]N(k + \frac{1}{2}) \\

**定理2.26.2.**  $\bar{\Gamma}(s)\Omega(s) = \sigma(s)\bar{\Gamma}(s)$

以前直接利用 $\bar{\Gamma}(s), \Gamma(s)$ 证明 $\bar{\Gamma}(s)\sigma(\frac{1}{2}) \otimes I_{2s}\Gamma(s) = \frac{1}{2s}\sigma(s)$ 十分困难，没有成功，根本原因在于 $\bar{\Gamma}(s), \Gamma(s)$ 没有简洁规律的显式表示，所以无从下手。那时只是对低自旋情形给出了严格的证明，对于一般情形实际上仍是猜想。而本节利用 $\bar{N}(s), N(s)$ 简洁有规律的显式表示，就很容易严格证明了 $\bar{N}(s)\sigma(\frac{1}{2}) \otimes I_{2s}N(s) = \frac{1}{2s}\sigma(s)$ 这个结论，且 $\sigma(s)$ 正是第一章的那个自旋矩阵。当然 $\bar{N}(s)\sigma(\frac{1}{2}) \otimes I_{2s}N(s) = \frac{1}{2s}\sigma(s)$ 成立也意味着 $\bar{\Gamma}(s)\sigma(\frac{1}{2}) \otimes I_{2s}\Gamma(s) = \frac{1}{2s}\sigma(s)$ 成立，它们两者是等价的，也相当于间接证明了 $\bar{\Gamma}(s)\sigma(\frac{1}{2}) \otimes I_{2s}\Gamma(s) = \frac{1}{2s}\sigma(s)$ 。这给出了一种启示：对于原本很难或不能实现的计算，等价变换为一种新的形式后，就可以方便或容易计算了。

# 第三章 范德蒙矩阵的数学分析

自我评述：我运用范德蒙行列式的相关知识，一举解决了多个三年来未彻底求解的代数问题。正所谓一点突破，则全面突破，并以点带面，一系列问题得到了彻底地解决。前面多个章节的相关问题都得到了完美圆满的解决，极大推进了数学和物理的研究进度和深度，获得了大量有用的成果。具体包括三大问题的完美解决：一是三个二元通项公式的完美解决(第四章)；二是无质量任意自旋粒子对易或反对易函数的完美解决(第四章)；三是两个自旋展开式的完美解决(第十六章)。在此基础上并对照之前用其它多种方法解得的结论，一一对比获得了一系列新的组合恒等式，这些恒等式对后续的数学物理研究十分有价值，是一个个新的数学利器。本章隐含了很多新的数学结构，需要深入发掘，也许需要几个星期，也许需要几个月，甚至需要几年。所以慢慢来、不要急，一步一个脚印，稳步往前走。可以先放一放，先解决其它更重要的问题后，再来解决此问题，总之一切随缘。

# 第四章 重要的复合常数不变张量

了自我评述：本章对多个重要的复合常数不变张量进行了深入分析，对复合常数不变张量进行了分解，部分解决求得了其中二元数列的通项公式，并结合线性代数方法得到一些十分有用的结论，是后续研究高自旋粒子的一个有力数学工具。

### 7.2.2 $i = n-2l$ 情形下通项公式猜想的证明

$$\text{引理7.2.1. } \sum_{a+b=k} C_a^c C_b^d = C_{k+1}^{c+d+1} [\Rightarrow] \sum_{j=1}^{n-1} C_{n-j}^1 C_{j-1}^{2l} = C_n^{2l+2}, \sum_{j=1}^{n-1} C_{n-j}^1 C_j^{2l+1} = C_{n+1}^{2l+3}$$

以上引理肯定是正确的, 我在书上看见过这个公式, 在后面章节我会给出两个易懂的证明方法。

$$\text{定理7.2.1. } m(s, n; n-2l) = \frac{1}{2^{2l+1} s} [(2s+1)C_n^{2l} - C_{n+1}^{2l+1}]; s \neq 0 \in \mathbb{C}, n \geq 0, 0 \leq l \leq [n/2]$$

证明: 采用数学归纳法证明此定理。

第一步:  $l=0$ 时成立:

$$m(s, n; n-0) = \frac{1}{2^1 s} [(2s+1)C_n^0 - C_{n+1}^1]$$

第二步: 假设 $l=l$ 时成立:

$$m(s, n; n-2l) = \frac{1}{2^{2l+1} s} [(2s+1)C_n^{2l} - C_{n+1}^{2l+1}]$$

第三步:  $l'=l+1 \geq 1$ 时:

$$\Rightarrow m(s, n; n-2l-2) = \frac{1}{4} \sum_{j=1}^{n-1} (n-j)m(s, j-1; j-1-2l)$$

$$= \frac{1}{4} \sum_{j=1}^{n-1} \frac{n-j}{2^{2l+1} s} [(2s+1)C_{j-1}^{2l} - C_j^{2l+1}]$$

$$= \frac{1}{2^{2l+3} s} \sum_{j=1}^{n-1} [(2s+1)C_{n-j}^1 C_{j-1}^{2l} - C_{n-j}^1 C_j^{2l+1}]$$

$$= \frac{1}{2^{2l+3}s} [(2s+1)C_n^{2l+2} - C_{n+1}^{2l+3}]$$

此步证明了  $l' = l + 1$  时命题成立。

第四步: 根据以上归纳法推理, 命题成立, 定理得证。  $\square$

$$\text{推论7.2.3. } m(s, n; n-2l) = \frac{1}{2^{2l+1}s} [(2s+1)C_n^{2l} - C_{n+1}^{2l+1}] = \frac{1}{2^{2l+1}s} (2sC_n^{2l} - C_n^{2l+1}) = \frac{C_n^{2l}}{2^{2l}} - \frac{1}{s} \frac{C_n^{2l+1}}{2^{2l+1}}; s \neq 0 \in \mathbb{C}, n \geq 0$$

对于求解  $m(s, n; i)$ ,  $n(s, n; i)$  的通项公式, 我已思考了近三年, 一直没得到彻底解决。终于在2023年8月15日那天灵感突发, 一下子就猜测得到了  $m(s, n; i)$  的通项公式, 然后采用数学归纳法严格证明了它。就这样长久坚持了三年, 问题终于彻底解决了。但是同样的技巧对求解  $c(s, n; n-2l)$  的通项公式却毫无帮助、无能为力, 仍需努力!

## 9 展开系数的线性代数解法(s只能取一定范围内的整数或半整数)

本节线性代数解法体现了数学的全息原理, 只需通过求解一个投影方向, 便可以得到整个空间的解, 即一个投影方向就包含了整个空间的信息, 体现了全息原理。

### 9.1 $M^{\{\alpha_1, \dots, \alpha_n\}}(s, n; w), s \geq \frac{1}{2} \lfloor \frac{n}{2} \rfloor$ 展开系数的线性代数解法

由于  $m(s, n; i)$  某些情况下与  $w$  独立无关, 对某些  $w$  代数同构, 具有同样的展开系数。也只需求任何一个  $w$  的展开系数即可, 哪个方便用哪个, 这里取  $w = 1$ 。且这节的  $s$  只能取一定范围内的整数或半整数, 超出范围则不适用, 故而没有上面章节的结论普遍。

## 9.5 $\Gamma^{\alpha_{1\zeta} \cdots \alpha_{n\zeta}}(s, n; w)$ , $s \geq \frac{n}{2} | \frac{1}{2}$ 展开系数的线性代数解法

### 9.5.1 $\Gamma^{z_{1\zeta} \cdots z_{n\zeta}} l_{\zeta}(s, n; w)$ 的性质

$$\text{推论9.5.1. } \Gamma^{z_{1\zeta} \cdots z_{n\zeta}} l_{\zeta}(s, n; w) := \frac{1}{2^n} \Gamma_{k_{\zeta}}^{A_{1\zeta} \cdots A_{n\zeta} A_{(n+1)\zeta} \cdots A_{(2s)\zeta}}(s) \prod_{i=1}^n \sigma_{z_{i\zeta}}^{B_{i\zeta}} \Gamma_{B_{1\zeta} \cdots B_{n\zeta} A_{(n+1)\zeta} \cdots A_{(2s)\zeta}}^{l_{\zeta}}(s)$$

引理9.5.1.

$$\Gamma^{z_{1\zeta} \cdots z_{n\zeta}} l_{\zeta}(s, n; w) = \frac{1}{2^n} \begin{bmatrix} (C_{2s}^0)^{-1} \sum_{i=0}^n (-1)^i C_n^i C_{2s-n}^{0-i} & 0 & \cdots & 0 & 0 \\ 0 & (C_{2s}^1)^{-1} \sum_{i=0}^n (-1)^i C_n^i C_{2s-n}^{1-i} & \cdots & 0 & 0 \\ 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & \cdots & C_{2s}^{1-2s} \sum_{i=0}^n (-1)^i C_n^i C_{2s-n}^{2s-1-i} & 0 \\ 0 & 0 & \cdots & 0 & (C_{2s}^{2s})^{-1} \sum_{i=0}^n (-1)^i C_n^i C_{2s-n}^{2s-i} \end{bmatrix}$$

### 9.5.2 $\Gamma^{\alpha_{1\zeta} \cdots \alpha_{n\zeta}}(s, n; w)$ 展开系数的线性代数解法

$$\text{定理9.5.1. } \Gamma^{\alpha_{1\zeta} \cdots \alpha_{n\zeta}}(s, n; w) = \frac{1}{n!} \sum_k^{[n/2]} c(s, n; n-2k) \Omega^{n-2k}(s; w), c(s, n; n-2k-1) = 0$$

由于 $c(s, n; i)$ 某些情况下与 $w$ 独立无关, 对某些 $w$ 代数同构, 具有同样的展开系数。也只需求任何一个 $w$ 的展开系数即可, 哪个方便用哪个, 这里取 $w = 1$ 。怎么推出来还需严格仔细写出来, 久了自己都不记得了。且这节的 $s$ 只能取一定范围内的整数或半整数, 超出范围则不适用, 故而没有上面章节的结论普遍。

$$\text{推论9.5.2. } \Gamma^{z_{1\zeta} \cdots z_{n\zeta}}(s, n; w = 1) = \sum_k^{[n/2]} c(s, n; n-2k) \sigma_z^{n-2k}(s; w = 1) = \frac{1}{2^n}$$

## 15 最基本的常数不变张量

最基本的常数不变张量：

$$\varepsilon_{AB}, \varepsilon^{AB}; \delta_{ab}, \delta^{ab}; \delta_{\alpha\beta}, \delta^{\alpha\beta}; \varepsilon_{\alpha\beta\gamma}; (\sigma, -i)_a^{A'A}; \sigma^{\alpha A B}; N_{Al}^k(s), N_k^{Al}(s) \quad (4.8)$$

以上是最基本的常数不变张量，本章与上一章其它所有的常数不变张量均可以由它们导出，所以只要以上几个常数不变张量的协变性得到证明，由它们导出的常数不变张量的协变性自然成立。

# 第五章 高维常数不变张量初步

自我评述：本章是在前面章节基础上，将常数不变张量全面系统地往高阶、甚至无穷阶和高低维时空两个方向发展，得到了高低维时空中的各种常数不变张量，从而为研究高低维时空粒子物理提供了一个有力的数学工具。

$\Leftrightarrow \delta\varphi(x) = \frac{i}{2}\varepsilon^{ab}[-i(x_a\partial_b - x_b\partial_a) + S_{ab}]\varphi(x)$

$\Leftrightarrow \varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}[-i(x_a\partial_b - x_b\partial_a) + S_{ab}]} \varphi(x)$

$\Leftrightarrow \varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x), M_{ab} = L_{ab} + S_{ab}$  □

推论2.2.3.  $e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\varphi(e^{-\varepsilon}x)$

推论2.2.4.  $x = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}(e^{-\varepsilon}x) \Leftrightarrow x = e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}x$

在态变换和坐标恒等式变换中隐含了洛伦兹群生成元： $M_{ab}$ ，生成元的含义是自变量不变，函数发生改变，它是一个算子。

## 2.3 平移变换

推论2.3.1.  $\varphi'(x) = \varphi(x + \theta) \Leftrightarrow \varphi'(x) = e^{\theta^a\partial_a}\varphi(x) \Leftrightarrow \varphi'(x) = e^{i\theta^a p_a}\varphi(x)$

推论2.3.2.  $e^{i\theta^a p_a}\varphi(x) = \varphi(x + \theta)$

简单的平移变换中隐含了平移生成元： $p_a$ 及其算子变换。

## 2.4 彭加莱群生成元对易关系

彭加莱群生成元 $M_{ab}, p_a$ 对易关系：

$$M_{ab} = L_{ab} + S_{ab}, L_{ab} = x_a p_b - x_b p_a, g_{ab} = \delta_{ab} \quad (5.1)$$

$$\begin{cases} i[M_{ab}, M_{cd}] = g_{ad}M_{bc} - g_{ac}M_{bd} + g_{bc}M_{ad} - g_{bd}M_{ac} \\ i[M_{ab}, p_c] = g_{bc}p_a - g_{ac}p_b, [p_a, p_b] = 0 \end{cases} \quad (5.2)$$

彭加莱群生成元 $L_{ab}, S_{ab}, p_a$ 对易关系：

$$\begin{cases} [L_{ab}, L_{cd}] = g_{ad}L_{bc} - g_{ac}L_{bd} + g_{bc}L_{ad} - g_{bd}L_{ac} \\ i[L_{ab}, p_c] = g_{bc}p_a - g_{ac}p_b, [p_a, p_b] = 0 \end{cases} \quad (5.3)$$

$$i[S_{ab}, S_{cd}] = g_{ad}S_{bc} - g_{ac}S_{bd} + g_{bc}S_{ad} - g_{bd}S_{ac} \quad (5.4)$$

$$[S_{ab}, L_{cd}] = 0, [S_{ab}, p_c] = 0 \quad (5.5)$$

## 2.5 生成元的意义

生成元可以生成相应的对称变换，生成元一般也是系统的守恒量，反过来，守恒量也是系统的生成元，并且生成元也形成一定的封闭代数。

## 3 无穷维常数不变张量

### 3.1 量子力学意义上的无穷维不变张量 [27, 28]

定义3.1.1.  $\hat{M}_{ab} := \hat{L}_{ab} + S_{ab}, \hat{L}_{ab} := x_a \hat{p}_b - x_b \hat{p}_a, \hat{p}_a := -i\partial_a, g_{ab} = \delta_{ab}$

$$\text{推论3.1.1.} \begin{cases} i[\hat{M}_{ab}, \hat{M}_{cd}] = g_{ad}\hat{M}_{bc} - g_{ac}\hat{M}_{bd} + g_{bc}\hat{M}_{ad} - g_{bd}\hat{M}_{ac} \Leftrightarrow \hat{M}_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} \hat{M}_{cd} e^{-\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} \\ i[\hat{L}_{ab}, \hat{L}_{cd}] = g_{ad}\hat{L}_{bc} - g_{ac}\hat{L}_{bd} + g_{bc}\hat{L}_{ad} - g_{bd}\hat{L}_{ac} \Leftrightarrow \hat{L}_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} \hat{L}_{cd} e^{-\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} \\ i[\hat{S}_{ab}, \hat{S}_{cd}] = g_{ad}\hat{S}_{bc} - g_{ac}\hat{S}_{bd} + g_{bc}\hat{S}_{ad} - g_{bd}\hat{S}_{ac} \Leftrightarrow \hat{S}_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}\hat{S}_{ef}} \hat{S}_{cd} e^{-\frac{i}{2}\vartheta^{ef}\hat{S}_{ef}} \end{cases}$$

$$\text{推论3.1.2.} \begin{cases} i[\hat{p}_a, \hat{M}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow \hat{p}_a = [e^\vartheta]_a^b e^{\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} \hat{p}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} \\ i[\hat{p}_a, \hat{L}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow \hat{p}_a = [e^\vartheta]_a^b e^{\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} \hat{p}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} \end{cases}$$

从上可知 $\hat{M}_{ab}, \hat{p}_a$ 是不变张量，但显然不是常数张量。换一种等价写法，可以将相对论中的洛伦兹变换和量子力学中的么正变换联系起来。

$$\text{推论3.1.3.} \begin{cases} i[\hat{M}_{ab}, \hat{M}_{cd}] = g_{ad}\hat{M}_{bc} - g_{ac}\hat{M}_{bd} + g_{bc}\hat{M}_{ad} - g_{bd}\hat{M}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} \hat{M}_{ab} e^{\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} = [e^\vartheta]_a^c [e^\vartheta]_b^d \hat{M}_{cd} \\ i[\hat{L}_{ab}, \hat{L}_{cd}] = g_{ad}\hat{L}_{bc} - g_{ac}\hat{L}_{bd} + g_{bc}\hat{L}_{ad} - g_{bd}\hat{L}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} \hat{L}_{ab} e^{\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} = [e^\vartheta]_a^c [e^\vartheta]_b^d \hat{L}_{cd} \\ i[\hat{S}_{ab}, \hat{S}_{cd}] = g_{ad}\hat{S}_{bc} - g_{ac}\hat{S}_{bd} + g_{bc}\hat{S}_{ad} - g_{bd}\hat{S}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{S}_{ef}} \hat{S}_{ab} e^{\frac{i}{2}\vartheta^{ef}\hat{S}_{ef}} = [e^\vartheta]_a^c [e^\vartheta]_b^d \hat{S}_{cd} \end{cases}$$

$$\text{推论3.1.4.} \begin{cases} i[\hat{p}_a, \hat{M}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} \hat{p}_a e^{\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} = [e^\vartheta]_a^b \hat{p}_b \\ i[\hat{p}_a, \hat{L}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} \hat{p}_a e^{\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} = [e^\vartheta]_a^b \hat{p}_b \end{cases}$$

$$\text{推论3.1.5.} e^{\frac{i}{2}\varepsilon^{ab}\hat{M}_{ab}} \varphi(x) = e^{\frac{i}{2}\varepsilon^{ab}\hat{S}_{ab}} \varphi(e^{-\varepsilon}x), e^{i\theta^a p_a} \varphi(x) = \varphi(x + \theta)$$

$$\text{推论3.1.6.} \langle |\hat{P}_a|' \rangle = [e^\vartheta]_a^b \langle |\hat{P}_b| \rangle, \langle |\hat{J}_{ab}|' \rangle = [e^\vartheta]_a^c [e^\vartheta]_b^d \langle |\hat{J}_{cd}| \rangle, \langle |S_{ab}|' \rangle = [e^\vartheta]_a^c [e^\vartheta]_b^d \langle |S_{cd}| \rangle$$

$$\text{推论3.1.7.} \langle |\hat{P}_a|' \rangle = [e^\vartheta]_a^b \langle |\hat{P}_b| \rangle, \langle |\hat{J}_{\alpha_c}|' \rangle = [e^{(i\omega + \varsigma\epsilon) \cdot \sigma(s)}]_{\alpha_c}^{\beta_c} \langle |\hat{J}_{\beta_c}| \rangle$$

从上可知右边是洛伦兹变换，左边可以看作么正变换，即洛伦兹变换等价于么正变换。

$$\text{推论3.1.8.} [\hat{p}_a, \hat{p}_b] = 0 \Leftrightarrow \hat{p}_a = e^{-i\vartheta^b \hat{p}_b} \hat{p}_a e^{i\vartheta^b \hat{p}_b}$$

### 3.2 量子场论意义上的无穷维不变张量 [27, 28]

$$\text{推论3.2.1.} \begin{cases} i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow \hat{J}_{ab} = [e^\vartheta]_a^c [e^\vartheta]_b^d e^{\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} \hat{J}_{cd} e^{-\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} \\ i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} \hat{J}_{ab} e^{\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} = [e^\vartheta]_a^c [e^\vartheta]_b^d \hat{J}_{cd} \end{cases}$$

$$\text{推论3.2.2.} \begin{cases} i[\hat{P}_a, \hat{J}_{cd}] = \delta_{a[c}\hat{P}_{d]} \Leftrightarrow \hat{P}_a = [e^\vartheta]_a^b e^{\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} \hat{P}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} \\ i[\hat{P}_a, \hat{J}_{cd}] = \delta_{a[c}\hat{P}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} \hat{P}_a e^{\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} = [e^\vartheta]_a^b \hat{P}_b \end{cases}$$

$$\text{推论3.2.3.} [\hat{P}_a, \hat{P}_b] = 0 \Leftrightarrow \hat{P}_a = e^{-i\vartheta^b \hat{P}_b} \hat{P}_a e^{i\vartheta^b \hat{P}_b}$$

$$\text{推论3.2.4.} \langle |\hat{P}_a|' \rangle = [e^\vartheta]_a^b \langle |\hat{P}_b| \rangle, \langle |\hat{J}_{ab}|' \rangle = [e^\vartheta]_a^c [e^\vartheta]_b^d \langle |\hat{J}_{cd}| \rangle, \langle |S_{ab}|' \rangle = [e^\vartheta]_a^c [e^\vartheta]_b^d \langle |S_{cd}| \rangle$$

$$\text{推论3.2.5.} \langle |\hat{P}_a|' \rangle = [e^\vartheta]_a^b \langle |\hat{P}_b| \rangle, \langle |\hat{J}_{\alpha_c}|' \rangle = [e^{(i\omega + \varsigma\epsilon) \cdot \sigma(s)}]_{\alpha_c}^{\beta_c} \langle |\hat{J}_{\beta_c}| \rangle$$

猜测的协变方程：

$$\text{推论3.2.6.} [(s + \phi)\hat{P}_a + i\hat{J}_{ab}\hat{P}^b]\psi(s, \varsigma) = 0$$

$$\text{推论3.2.7.} [(s + \phi)\hat{\partial}_a + i\hat{J}_{ab}\hat{\partial}^b]\Psi(x, F[\varphi(y)]) = 0$$

$$\text{推论3.2.8.} (\hat{P}^a \partial_a + m)\Psi(x, F[\varphi(y)]) = 0$$

$$\text{推论3.2.9.} \partial_a \Psi(x, F[\varphi(y)]) = \hat{P}_a \Psi(x, F[\varphi(y)])$$

### 3.3 量子场论意义上的一般不变张量 [27, 28]

$$\text{推论3.3.1. } \begin{cases} i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow \psi_\lambda = \Lambda_\lambda^\mu U^+ \psi_\mu U \\ i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow U\psi_\lambda U^+ = \Lambda_\lambda^\mu \psi_\mu \end{cases}$$

$$\text{推论3.3.2. } U\psi_\lambda U^+ = \Lambda_\lambda^\mu \psi_\mu, U = e^{iX}$$

### 3.4 量子场论算子代数

$$\text{推论3.4.1. } [x, \hat{p}_x] = i \Leftrightarrow \hat{p}_x \equiv -i\frac{\partial}{\partial x}, \Psi = \psi(x)$$

↓

$$\text{推论3.4.2. } [x_i, \hat{p}_j] = i\delta_{ij} \Leftrightarrow \hat{p}_i \equiv -i\frac{\partial}{\partial x_i}, \Psi = \psi(x_1, x_2, \dots, x_n)$$

↓

$$\text{推论3.4.3. } [\psi(x_i), \pi(x_j)] = i\delta_{ij} \Leftrightarrow \pi(x_i) \equiv -i\frac{\partial}{\partial \psi(x_i)}, \Psi = F[\psi(x_1), \psi(x_2), \dots, \psi(x_n), \dots, \psi(x_\infty)]$$

$$\Psi = \int dx F[\psi(x)] = \sum_i \Delta x_i F[\psi(x_i)] = \varepsilon F[\psi(x_1), \psi(x_2), \dots, \psi(x_n), \dots, \psi(x_\infty)]$$

# 第六章 常数不变张量与表象变换

自我评述：本章理清了常数不变张量与表象变换之间的对应关系，指出了表象变换矩阵就是一个常数不变张量。

## 1 一般 $s$ -自旋场各种旋量的定义

### 1.1 Penrose抽象符号规则 [1, 2]

以上说明 $\psi_{A_\zeta}, \psi^{A_\zeta}$ 是完全相关的，真正独立的只是其中一个，不妨选定 $\psi_{A_\zeta}$ 作为基本量。

$$\Leftrightarrow \mathbb{J}_a^{\beta\zeta} = \sigma_{\zeta ab}^{\beta\zeta} \sigma_{\zeta\alpha\zeta}^{bc} \partial_c \psi^{\alpha\zeta}$$

$$\Leftrightarrow \begin{cases} \mathbb{J}_y^{z\varsigma} = -\mathbb{J}_z^{y\varsigma} = -\varsigma \mathbb{J}_\pi^{x\varsigma} = i\sigma_{\varsigma\alpha\varsigma}^{xb} \partial_b \psi^{\alpha\varsigma} \\ \mathbb{J}_z^{x\varsigma} = -\mathbb{J}_x^{z\varsigma} = -\varsigma \mathbb{J}_\pi^{y\varsigma} = i\sigma_{\varsigma\alpha\varsigma}^{yb} \partial_b \psi^{\alpha\varsigma} \\ \mathbb{J}_x^{y\varsigma} = -\mathbb{J}_y^{x\varsigma} = -\varsigma \mathbb{J}_\pi^{z\varsigma} = i\sigma_{\varsigma\alpha\varsigma}^{zb} \partial_b \psi^{\alpha\varsigma} \\ \mathbb{J}_x^{x\varsigma} = \mathbb{J}_y^{y\varsigma} = \mathbb{J}_z^{z\varsigma} = i\varsigma \sigma_{\varsigma\alpha\varsigma}^{\pi b} \partial_b \psi^{\alpha\varsigma} \end{cases} \quad \square$$

\end{aligned}$$

此方程(3.3.2)完全等价于Yang-Mills场方程，它就是Yang-Mills场方程的自旋张量表述形式。

$$\text{引理2.8.1. } \mathbb{J}_a^{\beta_\zeta \sigma} = -i\sigma_{\zeta ab}^{\beta_\zeta} J^{b\sigma} \Leftrightarrow \begin{cases} \mathbb{J}_y^{z_\zeta \sigma} = -\mathbb{J}_z^{y_\zeta \sigma} = -\zeta \mathbb{J}_\pi^{x_\zeta \sigma} = J^{x\sigma} \\ \mathbb{J}_z^{x_\zeta \sigma} = -\mathbb{J}_x^{z_\zeta \sigma} = -\zeta \mathbb{J}_\pi^{y_\zeta \sigma} = J^{y\sigma} \\ \mathbb{J}_x^{y_\zeta \sigma} = -\mathbb{J}_y^{x_\zeta \sigma} = -\zeta \mathbb{J}_\pi^{z_\zeta \sigma} = J^{z\sigma} \\ \mathbb{J}_x^{x_\zeta \sigma} = \mathbb{J}_y^{y_\zeta \sigma} = \mathbb{J}_z^{z_\zeta \sigma} = \zeta J^{\pi\sigma} \end{cases}$$

以上后面那个方程形式上相当于两个同时有电荷和磁荷的电磁场方程，并且满足洛伦兹协变，表征无挠引力场，和Einstein方程成立与否无关。所以对电磁场的一些分析技术可以用在此，从而可以得到引力的一些性质。

$$\text{定义2.10.1. } \Omega(\zeta) = \left( \begin{bmatrix} 0 & 0 \\ -\sigma_{\zeta y} & \sigma_{\zeta x} \end{bmatrix}, \begin{bmatrix} \sigma_{\zeta y} & -\sigma_{\zeta x} \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} \right)$$

以上协变方程表明在某种特殊情况下 $(\gamma, -i\zeta)_a$ 表现出某种协变性。一般协变方程以Pauli矩阵为基础进行构造，此方程却用光子自旋矩阵构造了一个完整协变的方程，这是我第一次见到这样的情况。之所以会出现如此的情况，是场和源的全对称性的缘故。

### 3.2 引力场Yang-Mills规范方程的旋量表述形式

只要将Einstein方程 $R^{ab} = -8\pi G(T^{ab} - \frac{1}{2}g^{ab}T) + \Lambda g^{ab}$ 代入毕安奇恒等式的各种表述形式的源项，并将相应的恒等号换为等号，即可得到引力场物理Yang-Mills规范方程的各种表述形式，形式上与毕安奇恒等式的各种表述形式完全一致，不再重复写出。从本质上讲，引力场Yang-Mills规范方程只是引力场的恒等式，与Einstein方程成立与否无关，但真正描述物理的是Einstein方程，只有将Einstein方程应用于引力场规范恒等式的源项后，引力场Yang-Mills规范方程才真正带有物理的引力源项，此时的引力场Yang-Mills规范方程才成为一个真正的物理方程。所以这一点完全不同于电磁场和Yang-Mills场情形，电磁场和Yang-Mills场的规范方程不只是恒等式，直接描述真正的物理。

### 3.3 自我评述

事实上，电磁场和引力场都可以归结到Yang-Mills场情形，当 $\sigma$ 为空时是电磁场；当 $\sigma = \beta_\kappa$ 时是引力场；当 $\sigma$ 为多个字母时，可以描述更一般情形。 $\sigma$ 既可以为内部指标也可以为外部指标，甚至是两类指标的混合，所以Yang-Mills场数学形式上已是很一般的情形了。

# 第十一章 各种粒子的自旋方程

自我评述：在此章中我独立创新地提出了一种全新的粒子方程表述形式：自旋方程，此方程直接用自旋和自旋张量矩阵构造，并注意到自旋张量同时也是场量相应表示的变换矩阵，所以此方程物理意义十分明确，可以根据粒子场量变换规律简单直接地写出相应的粒子方程，它正确描述了中微子、电磁场、Yang-Mills 场和电子等经典方程，并发现其无质量表示完全等价于全对称的Penrose旋量方程，当然它比Penrose旋量方程更广泛，可以描述更多物理方程。我继续利用自旋表述这个思想，进一步得到了正确描述Einstein引力场和引力微子的低一阶导数自旋方程。在以上这些自旋表述形式中可以很自然地引入一个标量场，从而推广得到了一个更有意思的方程：开关型自旋方程，在标量场为零时，自由粒子可以存在，在标量场不为零时，自由粒子不存在。此标量场的作用就象开关一样，控制粒子的产生与湮灭，这就为粒子的产生与湮灭提供了一种新的物理机制。

$$\text{性质1.1.1. } W_ap^a = 0, W_a(s, \varsigma)p^a = 0$$

说明自旋矢量与动量正交，且只有三个独立分量。

$$\text{性质1.1.2. } *L_{ab}p^b = 0$$

$$\Leftrightarrow [s\partial_a\partial^a + 0]\psi = 0$$

$$\Leftrightarrow \partial_a\partial^a\psi = 0 \quad \square$$

& \Leftrightarrow \begin{cases} \text{当 } \phi \neq 0 \text{ 时, } [(s + \phi)\partial_a + iS_{ab}(s, \varsigma)\partial^b]\psi(s, \varsigma) = 0 \text{ 无平面波解} \\ \text{当 } \phi = 0 \text{ 时, } [(s + \phi)\partial_a + iS_{ab}(s, \varsigma)\partial^b]\psi(s, \varsigma) = 0 \text{ 有平面波解} \end{cases} \quad \square
\end{aligned}$$

即此方程中的 $\phi$ 有类似开关的作用。

推论2.2.1.  $[s\partial_a + iS_{ab}(s, \varsigma)\partial^b]\psi(s, \varsigma) = 0$ 有平面波解 $\psi(s, \varsigma) = [\frac{1}{2}(\zeta - 1)\psi_s, 0, \dots, 0, \frac{1}{2}(\zeta + 1)\psi_{-s}]^T e^{ip \cdot x}$

在无质量情形，由于 $F_{ab}^\sigma, A_a^\sigma$ 完全相互独立，无法得到更简洁、更有意义的结论，且有多余的方程，显得拖泥带水不够简洁，也无法自然地高自旋情形推广。所以Bargmann-Wigner方程似乎不太适合描写无质量粒子，更适合描写无质量粒子的是Penrose旋量方程<sup>[1, 2]</sup>(自旋方程)。

采用数学归纳法并运用 $s = \frac{3}{2}$ 和 $s = 2$ 的推理技巧可容易并严格证明得到以上两个定理，下面开始证明。

## 6.3 用数学归纳法严格证明以上两个定理

证明：采用数学归纳法一起证明以上两个定理。

第一步： $s = 1/2$ 时成立：

$$\left\{ \begin{array}{l} [\gamma^a(\zeta)\partial_a + m]\psi_{[\lambda_\zeta]}^\sigma = 0 \\ \psi_{\lambda_\zeta}^\sigma \text{除}\sigma\text{外全对称} \end{array} \right. \Leftrightarrow \left\{ \begin{array}{l} [\gamma^d(\zeta)\partial_d + m]\underbrace{A_{ab\cdots}[\lambda_\zeta]}_0^\sigma = 0, \underbrace{A_{ab\cdots}[\lambda_\zeta]}_0^\sigma \text{除}\lambda_\zeta\sigma\text{外全对称} \\ \delta^{ab}\underbrace{A_{ab\cdots}[\lambda_\zeta]}_0^\sigma = 0, \gamma^a(\zeta)\underbrace{A_{ab\cdots}[\lambda_\zeta]}_0^\sigma = 0 \\ \psi_{\lambda_\zeta}^\sigma = \underbrace{A_{ab\cdots}[\lambda_\zeta]}_0^\sigma \end{array} \right.$$

第二步：假设 $s = n - 1/2$ 时成立：

$$\left\{ \begin{array}{l} [\gamma^a(\zeta)\partial_a + m]\psi_{\underbrace{[\lambda_\zeta]\mu_\zeta\cdots\eta_\zeta}_{2n-1}}^\sigma = 0 \\ \psi_{\underbrace{[\lambda_\zeta]\mu_\zeta\cdots\eta_\zeta}_{2n-1}}^\sigma \text{除}\sigma\text{外全对称} \end{array} \right. \Leftrightarrow \left\{ \begin{array}{l} [\gamma^d(\zeta)\partial_d + m]\underbrace{A_{ab\cdots}[\eta_\zeta]}_{n-1}^\sigma = 0, \underbrace{A_{ab\cdots}[\eta_\zeta]}_{n-1}^\sigma \text{除}\eta_\zeta\sigma\text{外全对称} \\ \delta^{ab}\underbrace{A_{ab\cdots}[\eta_\zeta]}_{n-1}^\sigma = 0, \gamma^a(\zeta)\underbrace{A_{ab\cdots}[\eta_\zeta]}_{n-1}^\sigma = 0 \\ \psi_{\underbrace{[\lambda_\zeta]\mu_\zeta\cdots\eta_\zeta}_{2n-1}}^\sigma = \underbrace{\mathbb{X}_{\lambda_\zeta\mu_\zeta}^a}_{n-1} \cdots \underbrace{A_{a\cdots}[\eta_\zeta]}_{n-1}^\sigma \end{array} \right.$$

第三步 $s = n$ 时，

$$1: \left\{ \begin{array}{l} [\gamma^a(\zeta)\partial_a + m]\psi_{\underbrace{[\lambda_\zeta]\mu_\zeta\cdots\eta_\zeta\xi_\zeta}_{2n}}^\sigma = 0 \\ \psi_{\underbrace{[\lambda_\zeta]\mu_\zeta\cdots\eta_\zeta\xi_\zeta}_{2n}}^\sigma \text{除}\sigma\text{外全对称} \end{array} \right.$$

## 6.4 对有质量自旋的Bargmann-Wigner方程的评述

从上可知，在平坦时空中Bargmann-Wigner方程在半整数自旋情形等价于Rarita-Schwinger方程<sup>[21]</sup>，在整数自旋情形等价于Klein-Gordon方程<sup>[23]</sup>，揭示了Bargmann-Wigner方程深刻丰富的物理内涵。但如果考虑一般的源项，并不能得到这个等价结果，只有满足一定条件的源项才能成立，并且只有自旋为  $s = \frac{1}{2}$  和  $s = 1$  才能带源项，对于自旋为  $s = \frac{3}{2}$  或以上，方程内在自恰性要求源项必须为零。另外在弯曲时空中，由于广义协变导数项的存在导致这个等价结论不再成立，这个情况不如Penrose旋量方程或自旋方程的性质好。总的来说，Penrose旋量方程或自旋方程更适合描写无质量粒子，而Bargmann-Wigner方程更适合描写有质量粒子。

# 第十四章 高级表象变换技术

自我评述：本章是对前面章节内容的进一步充实和深化，我换成从表象变换的角度去研究同一个物理问题，为后续的各种自旋粒子洛伦兹变换多项式表示的证明提供了一个数学基础，并同时用表象变换技术提出了全新的粒子耦合理论。

## 1 高级表象变换技巧

### 1.1 表象变换与常数不变张量

定理1.1.1.  $\psi' = S\psi \Rightarrow \Lambda(\psi') = S\Lambda(\psi)S^{-1} \Leftrightarrow S = \Lambda(\psi')S\Lambda^{-1}(\psi) \Leftrightarrow S^{-1} = \Lambda(\psi)S^{-1}\Lambda^{-1}(\psi')$

所以表象变换就是一个二阶常数不变张量。写成分量形式如下：

推论1.1.1.  $\psi'^{\alpha'} = S^{\alpha'}_{\alpha}\psi^{\alpha}, \psi^{\alpha} = S^{-1\alpha}_{\alpha'}\psi'^{\alpha'}$

### 1.4 关于表象变换矩阵 $\hat{S}(s)$ 的一个重要定理及其证明

定义1.4.1.  $\pi(s, s') := \Omega(s') \otimes I_{2(s-s')-1} + I_{4s'} \otimes \sigma(s - s' - 1); s' \geq 0, s - s' \geq 1$

引理1.4.1.  $\hat{S}(s)\Omega(s = 1, \frac{3}{2}, 2)\hat{S}^+(s) = \begin{bmatrix} \sigma(1) & 0 \\ 0 & \sigma(0) \end{bmatrix}, \begin{bmatrix} \sigma(\frac{3}{2}) & 0 & 0 \\ 0 & \sigma(\frac{1}{2}) & 0 \\ 0 & 0 & \sigma(\frac{1}{2}) \end{bmatrix}, \begin{bmatrix} \sigma(2) & 0 & 0 \\ 0 & \sigma(1) & 0 \\ 0 & 0 & \sigma(\frac{1}{2}) \otimes I + I \otimes \sigma(\frac{1}{2}) \\ 0 & 0 & 0 & \sigma(\frac{1}{2}) \otimes I + I \otimes \sigma(\frac{1}{2}) \end{bmatrix}$

定理1.4.1.

$\hat{S}(s)\Omega(s) = \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s,0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s-1) \end{bmatrix} \hat{S}(s)[\Leftrightarrow]\Omega(s)\hat{S}^+(s) = \hat{S}^+(s) \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s,0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s-1) \end{bmatrix}$

证明：采用数学归纳法证明此定理。

第一步： $s' = 1$ 时成立： $\hat{S}(1)\Omega(1) = \begin{bmatrix} \sigma(1) & 0 \\ 0 & \sigma(0) \end{bmatrix} \hat{S}(1)$

第二步：假设 $s' = s - \frac{1}{2}$ 时成立：

$$\hat{S}(s - \frac{1}{2})\Omega(s - \frac{1}{2}) = \begin{bmatrix} \sigma(s - \frac{1}{2}) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s - \frac{1}{2}, 0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s - \frac{1}{2}, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s - \frac{1}{2}, s - \frac{1}{2} - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s - \frac{1}{2}, s - \frac{1}{2} - 1) \end{bmatrix} \hat{S}(s - \frac{1}{2})$$

第三步:  $s' = s$ 时,  $\hat{S}(s)\Omega(s) = \begin{bmatrix} \tilde{S}(s) & 0 \\ 0 & I_{4^{s-4s}} \end{bmatrix} [I \otimes \hat{S}(s - \frac{1}{2})][\sigma(\frac{1}{2}) \otimes I_{2^{2s-1}} + I \otimes \Omega(s - \frac{1}{2})]$

$$= \begin{bmatrix} \tilde{S}(s)[\sigma(\frac{1}{2}) \otimes I_{2s} + I \otimes \sigma(s - \frac{1}{2})] & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{3}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s - 1) \end{bmatrix} [I \otimes \hat{S}(s - \frac{1}{2})]$$

$$= \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s, 0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s - 1) \end{bmatrix} \begin{bmatrix} \tilde{S}(s) & 0 \\ 0 & I_{4^{s-4s}} \end{bmatrix} [I \otimes \hat{S}(s - \frac{1}{2})]$$

$$= \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s, 0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s - 1) \end{bmatrix} \hat{S}(s)$$

此步证明了  $s' = s$ 时成立。

第四步: 根据以上归纳法推理, 命题成立, 定理得证。 □

$$\text{推论1.4.1. } \hat{S}(s)\Omega(s)\hat{S}^+(s) = \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s, 0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s, \frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s, s - \frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s, s - 1) \end{bmatrix}$$

自我评述：只要按以上方法，任何一个 $\Omega(s)$ 都可以通过表象变换具体分解成多个单自旋态的直和，这个问题原则上算是彻底解决了。实际运用还需作一些计算，将具体的表象变换显式地写出来以便使用。同时也构造性地证明了 $\Omega(s)$ 确实完全由单自旋态组成，没有多余成分。 $\Omega(s)$ 不会同时包含玻色和费米自旋态，它表征了一个玻色或费米多重态。并且它遍历了高低玻色或费米自旋态，除最高自旋态外一般情况下其它自旋态均有多个冗余态。

## 2 单粒子的相对论洛伦兹推动变换

### 2.1 坐标的洛伦兹变换 [24-26]

约定： $O$ 在 $O'$ 中的速度为 $\vec{v}$ ,  $v \neq 1$ ,  $O'$ 在 $O$ 中的速度为 $-\vec{v}$ , 此约定好处是可以直观描述运动粒子。

坐标及其坐标微分的相对论洛伦兹推动变换的一般形式：

$$\text{定义2.1.1. } \begin{cases} \nabla' = \nabla - \gamma_v \vec{v} \partial_t + (\gamma_v - 1) \vec{v} / v^2 (\vec{v} \cdot \nabla) \\ \partial_{t'} = \gamma_v (\partial_t - \vec{v} \cdot \nabla), \gamma_v \equiv (1 - v^2)^{-\frac{1}{2}} \end{cases}$$

$$\text{定义2.1.2. } \begin{cases} \vec{r}' = \vec{r} + \gamma_v \vec{v} t + (\gamma_v - 1) (\vec{v} \cdot \vec{r}) \vec{v} / v^2 \\ t' = \gamma_v (t + \vec{v} \cdot \vec{r}), \gamma_v \equiv (1 - v^2)^{-\frac{1}{2}} \end{cases} \quad \begin{cases} d\vec{r}' = d\vec{r} + \gamma_v \vec{v} dt + (\gamma_v - 1) (\vec{v} \cdot d\vec{r}) \vec{v} / v^2 \\ dt' = \gamma_v (dt + \vec{v} \cdot d\vec{r}) \end{cases}$$

以上变换是整个狭义相对论的重要基础, 另一个重要变换是矢量旋转变换。

$$\text{推论2.1.1. } \vec{r}'^2 - t'^2 = \vec{r}^2 - t^2 = \text{不变量}, d\vec{r}'^2 - dt'^2 = d\vec{r}^2 - dt^2 = \text{不变量}$$

$$\text{定义2.1.3. } L_{\vec{v}} := \begin{bmatrix} 1 & 0 & 0 & -i\gamma_v v_x \\ 0 & 1 & 0 & -i\gamma_v v_y \\ 0 & 0 & 1 & -i\gamma_v v_z \\ i\gamma_v v_x & i\gamma_v v_y & i\gamma_v v_z & \gamma_v \end{bmatrix} + \frac{\gamma_v - 1}{v^2} \begin{bmatrix} v_x v_x & v_x v_y & v_x v_z & 0 \\ v_y v_x & v_y v_y & v_y v_z & 0 \\ v_z v_x & v_z v_y & v_z v_z & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, L_{\vec{v}} L_{-\vec{v}} = L_{-\vec{v}} L_{\vec{v}} = I$$

$$\text{引理2.1.1. } (\vec{v} \cdot R)^2 + (\vec{v} \cdot L)^2 = \vec{v}^2$$

推论2.1.3.

$$L_{\vec{v}} = e^{-\ln[\gamma_v(1+v)] \hat{v} \cdot L} = 1 - \gamma_v (\vec{v} \cdot L) + \frac{\gamma_v - 1}{v^2} (\vec{v} \cdot L)^2 = \gamma_v (1 - \vec{v} \cdot L) - \frac{\gamma_v - 1}{v^2} (\vec{v} \cdot R)^2, L_{\vec{v}} L_{-\vec{v}} = L_{-\vec{v}} L_{\vec{v}} = I$$

### 2.2 速度合成公式

$$\text{推论2.2.1. } \vec{u}' = [\vec{u} + \gamma_v \vec{v} + (\gamma_v - 1) (\vec{v} \cdot \vec{u}) \vec{v} / v^2] / [\gamma_v (1 + \vec{v} \cdot \vec{u})]$$

$$\text{推论2.2.2. } 1 - \vec{u}'^2 = \frac{(1 - \vec{u}^2)(1 - \vec{v}^2)}{(1 + \vec{v} \cdot \vec{u})^2}$$

$$\text{推论2.2.3. } \begin{cases} \gamma_{u'} \vec{u}' = \gamma_u \vec{u} + \gamma_v \vec{v} \gamma_u + (\gamma_v - 1) [\vec{v} \cdot (\gamma_u \vec{u})] \vec{v} / v^2 \\ \gamma_{u'} = \gamma_v [\gamma_u + \vec{v} \cdot (\gamma_u \vec{u})] \end{cases} \Leftrightarrow \begin{bmatrix} \gamma_{u'} \vec{u}' \\ i\gamma_{u'} \end{bmatrix} = L_{\vec{v}} \begin{bmatrix} \gamma_u \vec{u} \\ i\gamma_u \end{bmatrix}$$

### 2.3 有质量粒子四动量的洛伦兹推动变换

有质量单粒子： $m_0 \neq 0, u \neq 1, u' \neq 1$

可以从坐标的洛伦兹推动变换出发, 推导得到下面的能量动量的洛伦兹推动变换。

$$\text{推论2.3.1. } \begin{cases} \vec{p}' = \vec{p} + \gamma_v E \vec{v} + (\gamma_v - 1) (\vec{v} \cdot \vec{p}) \vec{v} / v^2 \\ E' = \gamma_v (E + \vec{v} \cdot \vec{p}) \end{cases} \Leftrightarrow \begin{bmatrix} \vec{p}' \\ iE' \end{bmatrix} = L_{\vec{v}} \begin{bmatrix} \vec{p} \\ iE \end{bmatrix}$$

$$\text{推论2.3.2. } \vec{p}'^2 - E'^2 = \vec{p}^2 - E^2 = -m_0^2 = \text{不变量}$$

### 2.4 不同速度参考系间的温度洛伦兹变换猜想

## 2.7 单粒子外力的广义相对论变换关系假设

定义2.7.1.  $\vec{a} \equiv \frac{d\vec{u}}{dt}, \vec{a}' \equiv \frac{d\vec{u}'}{dt'}, \vec{g} \equiv \frac{d\vec{v}}{dt}$

## 3 多粒子质点系的相对论洛伦兹变换

### 3.1 多粒子质点系的洛伦兹推动变换

引理3.2.1.  $\frac{dH(\vec{u})}{d\tau} \equiv \vec{u} \cdot \frac{d\vec{P}(\vec{u})}{d\tau}$

$$\text{推论3.2.2. } \begin{cases} \vec{f}'(\vec{u}') = \vec{f}(\vec{u}) + \gamma_v [\vec{u} \cdot \vec{f}(\vec{u})]\vec{v} + (\gamma_v - 1)[\vec{v} \cdot \vec{f}(\vec{u})]\vec{v}/v^2 \\ \vec{u}' \cdot \vec{f}'(\vec{u}') = \gamma_v [\vec{u} \cdot \vec{f}(\vec{u}) + \vec{v} \cdot \vec{f}(\vec{u})] = \gamma_v (\vec{u} + \vec{v}) \cdot \vec{f}(\vec{u}) \end{cases} \Leftrightarrow \begin{bmatrix} \vec{f}'(\vec{u}') \\ i\vec{u}' \cdot \vec{f}'(\vec{u}') \end{bmatrix} = L_{\vec{v}} \begin{bmatrix} \vec{f}(\vec{u}) \\ i\vec{u} \cdot \vec{f}(\vec{u}) \end{bmatrix}$$

推论3.2.3.  $\vec{f}'^2(\vec{u}') - [\vec{u}' \cdot \vec{f}'(\vec{u}')]^2 = \vec{f}^2(\vec{u}) - [\vec{u} \cdot \vec{f}(\vec{u})]^2 = \text{不变量}$

### 3.3 动质点系推动变换到静质点系

引理3.3.1.  $|\sum_i \vec{p}_i / \sum_i E_i| \leq 1$ , 等号有且仅当  $\vec{p}_i = E_i \vec{1}$  时成立。

定义3.3.1. 动质点系： $|\sum_i \vec{p}_i / \sum_i E_i| \neq 0$ , 静质点系： $|\sum_i \vec{p}_i / \sum_i E_i| = 0$

有质量动质点系到静质点系的洛伦兹推动变换：

$$\vec{v} = -\sum_i \vec{p}_i / \sum_i E_i \neq \vec{1} \Rightarrow \begin{cases} \vec{P}(\vec{v}) = \sum_i [\vec{p}_i + \gamma_v E_i \vec{v} + (\gamma_v - 1)(\vec{v} \cdot \vec{p}_i)\vec{v}/v^2] = 0 \\ M_0 = H(\vec{v}) = \sum_i \gamma_v (E_i + \vec{v} \cdot \vec{p}_i) = \sum_i E_i / \gamma_v \end{cases} \quad (15.9)$$

### 3.4 静质点系推动变换到动质点系

静质点系推动变换到动质点系：

$$\sum_i \vec{p}_i / \sum_i E_i = 0 \Rightarrow \begin{cases} H(\vec{v}) = \gamma_v \sum_i E_i = M, M \equiv \gamma_v M_0, M_0 \equiv \sum_i E_i \\ \vec{P}(\vec{v}) = \gamma_v \vec{v} \sum_i E_i = M\vec{v} \end{cases} \quad (15.10)$$

以上关系式的物理意义是：可以将质点系等效为一个粒子，当该质点系作运动时，可以等效为一个粒子的运动，并且与粒子一样符合相对论规律。并且该质点系质心静止时的总能就是该质点系的等效静止质量，质心运动时总能量就是等效的相对论动质量。因此质点系完全可以等效为一个粒子，反过来，也可以认为基本粒子就是一个质点系，难点是有相互作用的质点系是否还有如此的结论？是否可以按此线索对相互作用加一个约束，并得到新的物理？

### 3.5 单方向多光子系的洛伦兹推动变换

$$\Rightarrow \begin{cases} \vec{P}(\vec{v}) = \sum_i [E_i \vec{1} + \gamma_v E_i \vec{v} + (\gamma_v - 1)(\vec{v} \cdot \vec{1})E_i \vec{v}/v^2] = \sum_i \gamma_v E_i (1 + \vec{v} \cdot \vec{1}) \vec{1}' \\ H(\vec{v}) = \sum_i \gamma_v E_i (1 + \vec{v} \cdot \vec{1}) \\ \vec{P}^2(\vec{v}) - H^2(\vec{v}) = -M_0^2, M_0 = \sum_i E_i \sqrt{1 - v^2} = 0 \end{cases} \quad (15.12)$$

### 3.6 质点系的普适静止质量公式

综合以上结论，可以得到以下普适的静止质量公式：

$$M_0 = \sum_i E_i \sqrt{1 - \left( \frac{\sum_i \vec{p}_i}{\sum_i E_i} \right)^2} = \sqrt{\left( \sum_i E_i \right)^2 - \left( \sum_i \vec{p}_i \right)^2} = \sqrt{\sum_{i,j} (E_i E_j - \vec{p}_i \cdot \vec{p}_j)} \quad (15.13)$$

简化记号的质量公式： $M_0 = \sqrt{\sum (E_i E_j - \vec{p}_i \cdot \vec{p}_j)}$

$$M_0 = [M + m + V(\vec{r}_{M0}, \vec{r}_{m0})]$$

$$M + m = [\sqrt{M^2 + \vec{p}^2} + \sqrt{m^2 + \vec{p}^2} + V(\vec{r}_M, \vec{r}_m)]$$

### 13.7 推理过程的梳理

首先有以下猜想，可以利用多项式展开定理和自然数拆分的方式加以证明，但只在低阶情形得到了严格证明，一般情形仍是猜想，真正没被严格证明的是这个猜想，其它均可严格加以证明。

$$\text{猜想13.7.1. } [\Omega(s) \cdot \hat{p}]^{2s+1} = \sum_{k=1}^{[s+1/2]} X_k(s) [\Omega(s) \cdot \hat{p}]^{2s+1-2k}, \forall \hat{p}, \forall s \geq \frac{1}{2}$$

有了以上猜想后，一是可以通过线性代数方法直接求出  $X_k(s)$ ；二是通过以上推理严格得到递推关系，并可以完全严格解出系数，进行一一比对可以得到一系列恒等式。以下两个同构性的推论，一是可以从以上猜想和系数完全推理出来；二是可以从高级表象变换技术推理，但不能具体推得系数。

$$\text{推论13.7.1. } [\sigma(s-l) \cdot \hat{p}]^{2s+1} = \sum_{k=1}^{[s+1/2]} X_k(s) [\sigma(s-l) \cdot \hat{p}]^{2s+1-2k}, l=0, 1, \dots, [s]$$

$$\text{推论13.7.2. } e^{\vec{\nu} \cdot \sigma(s-l)} = \sum_{k=0}^{2s} A_k(s) [\vec{\nu} \cdot \sigma(s-l)]^k, l=0, 1, \dots, [s]$$

第一步:  $i = 0$ 时成立, 即

$$\begin{cases} i^{-0}\hat{p}[[ \times \sigma(s; w)]^0 = a_0(w)[\sigma(s; w) \cdot \hat{p}]\sigma(s; w) + b_0(w)\sigma(s; w)[\sigma(s; w) \cdot \hat{p}] - c_0\sigma^2(s; w)\hat{p} \\ a_0(w) = 0, b_0(w) = 0, c_0 = -\sigma^{-2}(s; w) \end{cases}$$

第二步: 假设 $i = n$ 时成立, 即

$$i^{-n}\hat{p}[[ \times \sigma(s; w)]^n = a_n(w)[\sigma(s; w) \cdot \hat{p}]\sigma(s; w) + b_n(w)\sigma(s; w)[\sigma(s; w) \cdot \hat{p}] - c_n(w)\sigma^2(s; w)\hat{p}$$

第三步:  $i = n + 1$ 时

$$\begin{aligned} & i^{-(n+1)}\hat{p}[[ \times \sigma(s; w)]^{n+1} \\ &= a_n(w)[\sigma(s; w) \cdot \hat{p}]\sigma(s; w) - ib_n(w)\sigma(s; w)[\sigma(s; w) \cdot \hat{p}][ \times \sigma(s; w) + ic_n(w)\hat{p} \times \sigma(s; w)\sigma^2(s; w) \\ &= a_n(w)[\sigma(s; w) \cdot \hat{p}]\sigma(s; w) + b_n(w)\{[\sigma(s; w) \cdot \hat{p}]\sigma(s; w) + \sigma(s; w)[\sigma(s; w) \cdot \hat{p}] - \sigma^2(s; w)\hat{p}\} \end{aligned}$$

### 2.3.8 一般情形下参数递推关系分析(猜想)

猜想2.3.1.  $\begin{cases} \sigma^2(s; w) = (s_1 \oplus s_2 \oplus \dots \oplus s_n)(s_1 \oplus s_2 \oplus \dots \oplus s_n + 1) = \hat{S}(s; w)[\hat{S}(s; w) + 1] \\ [\sigma_x(s; w), (s_1 \oplus s_2 \oplus \dots \oplus s_n)] = [\sigma_x(s; w), \hat{S}(s; w)] = 0, \hat{S}(s; w) := (s_1 \oplus s_2 \oplus \dots \oplus s_n) \end{cases}$

如果以上猜想成立，则上一节结论全部成立，只要将分母项理解为相应矩阵的逆即可，下面只是给出几个例子进行了严格的证明，其它均可如此进行，在此略去，不再展开。如果以上猜想不成立，则参数 $a_n, b_n, c_n$ 只有递推关系可用，无法解析地求出，一般只能写成其它章节的形式，即保留参数 $a_n, b_n, c_n$ 原有形式，无法进一步展开。

采用数学归纳法证明此定理。

第一步:  $i = 0$  时成立:  $\sigma^\alpha(s; w)[\sigma(s; w) \cdot \hat{p}]^0 \sigma_\alpha(s; w) = \sum_{k=0}^{[0/2]} [C_0^{2k} \sigma^2(s; w) - C_{0+1}^{2(k+1)}][\sigma(s; w) \cdot \hat{p}]^{0-2k}$

第二步: 假设  $i \leq n$  时成立:  $\sigma^\alpha(s; w)[\sigma(s; w) \cdot \hat{p}]^i \sigma_\alpha(s; w) = \sum_{k=0}^{[i/2]} [C_i^{2k} \sigma^2(s; w) - C_{i+1}^{2(k+1)}][\sigma(s; w) \cdot \hat{p}]^{i-2k}, 0 \leq i \leq n$

第三步:  $i = n + 1$  时,  $\sigma(s; w) \cdot \{\sigma(s; w) \cdot \hat{p}\}^{n+1} \sigma(s; w)$   
 $= -\{[\sigma(s; w) \cdot \hat{p}]^{2-(n+1)\%2} - [1 - (n+1)\%2]\sigma^2(s; w)\} - \sum_{l=0}^n c_{n+1}^l \{\sigma(s; w) \cdot \{[\sigma(s; w) \cdot \hat{p}]^l \sigma(s; w)\}\} [-\sigma(s; w) \cdot \hat{p}]^{n+1-l}$

$= -\{[\sigma(s; w) \cdot \hat{p}]^{2-(n+1)\%2} - [1 - (n+1)\%2]\sigma^2(s; w)\} - \sum_{k=0}^{[n/2]} \sum_{l=0}^n (-1)^{n+1-l} c_{n+1}^l [C_l^{2k} \sigma^2(s; w) - C_{l+1}^{2(k+1)}][\sigma(s; w) \cdot \hat{p}]^{n+1-2k}$

$= -\{[\sigma(s; w) \cdot \hat{p}]^{2-(n+1)\%2} - [1 - (n+1)\%2]\sigma^2(s; w)\} + \sum_{k=0}^{[n/2]} \sum_{l=2k}^n (-1)^{n-l} c_{n+1}^l [C_l^{2k} \sigma^2(s; w) - C_{l+1}^{2(k+1)}][\sigma(s; w) \cdot \hat{p}]^{n+1-2k}$

## 6.7 自旋矢量算符本征态 $\lambda(\hat{p}, -s\zeta)$

定义6.7.1.  $\lambda(\hat{p}, -s\zeta) := \lambda(\hat{p}, -s\zeta; s)$

定理6.7.1.  $[s \begin{bmatrix} 0 \\ 1 \\ i \end{bmatrix}_a + iS_{ab}(s, \zeta) \begin{bmatrix} 0 \\ 1 \\ i \end{bmatrix}_b] \lambda\left(\begin{bmatrix} 0 \\ 1 \\ i \end{bmatrix}, -s\zeta\right) \equiv 0 [\Leftrightarrow] [s\hat{p}_a + iS_{ab}(s, \zeta)\hat{p}^b] \lambda(\hat{p}, -s\zeta) \equiv 0$

定理6.7.2.  $[s\hat{p}_a + iS_{ab}(s, \zeta)\hat{p}^b] \lambda(\hat{p}, -s\zeta) = 0 [\Leftrightarrow] \begin{cases} W_a(\hat{p}, \zeta; s) \lambda(\hat{p}, -s\zeta) = -s\zeta \hat{p}_a \lambda(\hat{p}, -s\zeta) \\ W_a(\hat{p}, \zeta; s) := -i * S_{ab}(s, \zeta) \hat{p}^b = i\zeta S_{ab}(s, \zeta) \hat{p}^b \end{cases}$

性质6.7.1.  $W_a(\hat{p}, \zeta; s) = (\hat{W}(\hat{p}, \zeta; s), i\sigma(s) \cdot \hat{p})$ ,  $\hat{W}(\hat{p}, \zeta; s) = \sigma(s) - i\zeta\sigma(s) \times \hat{p}$

推论6.7.1.  $\hat{W}(\hat{p}, \zeta; s) \lambda(\hat{p}, -s\zeta) = -s\zeta \hat{p} \lambda(\hat{p}, -s\zeta) [\Rightarrow] \sigma(s) \cdot \hat{p} \lambda(\hat{p}, -s\zeta) = -s\zeta \lambda(\hat{p}, -s\zeta)$

推论6.7.2.  $\hat{W}(\hat{p}, \zeta; s) \lambda(\hat{p}, -s\zeta) = -s\zeta \hat{p} \lambda(\hat{p}, -s\zeta) [\Leftrightarrow] W_a(\hat{p}, \zeta; s) \lambda(\hat{p}, -s\zeta) = -s\zeta \hat{p}_a \lambda(\hat{p}, -s\zeta)$

$\lambda(\hat{p}, -s\zeta)$  是螺旋度算符、四维自旋矢量算符和自旋矢量算符的共同本征态, 本质上自旋矢量算符已完全包含了前两个算符。所以  $\lambda(\hat{p}, -s\zeta)$  本质上只是自旋矢量算符  $\hat{W}(\hat{p}, \zeta; s)$  的本征态, 其他两个只是它的推论而已, 而且  $\lambda(\hat{p}, -s\zeta)$  正是无质量粒子的本征态。

### 3 N+1=n维时空中的Dirac矩阵连乘积

在2023年9月5日-9月7日这三天灵感突发，我终于把这一章节的猜想都进行了严格的证明，本章节几乎所有的猜想都变成了定理。剩下的那个猜想事实上也可以认为被严格证明了，只是表述上有些复杂而已，需要进一步理清和梳理。

自我评述：以上Dirac矩阵连乘积展开是根据前几项的具体计算结果，然后归纳合理猜出来的，本质上还没有被严格证明，以后有时间再补上。以上虽然可以一步步严格具体完整写出来，但写法不够紧凑，无法方便运用，必须想一个好的写法表示出来，以便使用。

自我评述; 结合上面的结论可知, 对所有范德蒙恒等式左边添上 $(C_i^l C_{k-i}^r)$ , 右边简单变形并添上 $(C_{\alpha}^l C_{\beta}^r)$ , 恒等式依然成立, 结果不再具体列出, 直接应用即可。事实上, 可以继续两边无限添加类似的对应项, 恒等式仍然可以成立, 不再详细展开。若有实际需求时, 可以按以上思路再详细推导其具体形式。通过以上的数学技巧, 得到了很多有用的组合恒等式, 若应用到物理研究中去, 可以解决一些实际物理问题。

自我评述; 结合上面的结论可知, 对所有类范德蒙恒等式左边添上  $(C_i^l C_{k-i}^r)$ , 右边简单变形并添上  $(C_{\alpha}^l C_{\beta}^r)$ , 恒等式也依然成立, 结果不再具体列出, 直接应用即可。事实上, 可以继续两边无限添加类似的对应项, 恒等式仍然可以成立, 不再详细展开。若有实际需求时, 可以按以上思路再详细推导其具体形式。通过以上的数学技巧, 得到了很多有用的组合恒等式, 若应用到物理研究中去, 可以解决一些实际物理问题。

# 第二十章 非相对论性粒子的量子化

自我评述：在本章我充分运用四维傅里叶变换技巧，汇聚讨论了非相对论性粒子的二次量子化细节。

## 1 傅里叶分析技巧和平面波解展开 [42]

### 1.1 波函数的傅里叶展开

基本思想：将波函数按傅里叶分析完备唯一展开，将方程和约束看作对波函数的选取条件，最后得到的是符合方程和约束的完备平面波解。

定义1.1.1.  $k \equiv (\vec{k}, iE), x \equiv (\vec{r}, it), d^4x \equiv d^3\vec{r}dt, \omega_k \equiv \sqrt{\vec{k}^2 + m^2} > 0, p_a(\omega_k) \equiv (\vec{k}, i\omega_k)_a$

定义1.1.2.  $\int_{\vec{r}=-\infty}^{+\infty} \equiv \int_{r_x=-\infty}^{+\infty} \int_{r_y=-\infty}^{+\infty} \int_{r_z=-\infty}^{+\infty}, \int_{x=-\infty}^{+\infty} \equiv \int_{r_x=-\infty}^{+\infty} \int_{r_y=-\infty}^{+\infty} \int_{r_z=-\infty}^{+\infty} \int_{t=-\infty}^{+\infty}$

定义1.1.3.  $\int_{\vec{k}=-\infty}^{+\infty} \equiv \int_{p_x=-\infty}^{+\infty} \int_{p_y=-\infty}^{+\infty} \int_{p_z=-\infty}^{+\infty}, \int_{k=-\infty}^{+\infty} \equiv \int_{p_x=-\infty}^{+\infty} \int_{p_y=-\infty}^{+\infty} \int_{p_z=-\infty}^{+\infty} \int_{E=-\infty}^{+\infty}$

波函数的傅里叶展开：

$$\phi(\vec{r}, t) = \frac{1}{(2\pi)^{3/2}} \int_{\vec{k}=-\infty}^{+\infty} \int_{E=-\infty}^{+\infty} \Phi(\vec{k}, E) e^{i(\vec{k}\cdot\vec{r}-Et)} d^3\vec{k}dE, \Phi(\vec{k}, E) = \frac{1}{(2\pi)^{3/2}} \int_{\vec{r}=-\infty}^{+\infty} \int_{t=-\infty}^{+\infty} \phi(\vec{r}, t) e^{-i(\vec{k}\cdot\vec{r}-Et)} d^3\vec{r}dt$$

波函数的傅里叶展开紧凑形式：

$$\phi(x) = \frac{1}{(2\pi)^{3/2}} \int_{k=-\infty}^{+\infty} \Phi(k) e^{ik\cdot x} d^4k \Leftrightarrow \Phi(k) = \frac{1}{(2\pi)^{3/2}} \int_{x=-\infty}^{+\infty} \phi(x) e^{-ik\cdot x} d^4x \quad (20.1)$$

### 1.2 波函数的傅里叶展开与洛伦兹协变性

定义1.2.1.  $\Phi(k) \equiv \frac{1}{(2\pi)^{3/2}} \int_{x=-\infty}^{+\infty} \phi(x) e^{-ik\cdot x} d^4x, \Phi'(k') \equiv \frac{1}{(2\pi)^{3/2}} \int_{x'=-\infty}^{+\infty} \phi'(x') e^{-ik'\cdot x'} d^4x'$

对于以上两式数学上只是随意的两个定义，可以有随意的数学含义，但可以赋予其明确的物理意义，将前式看作在参考系O中的表达，后式看作在参考系O'中的表达。详细地说，将x看作时空坐标在参考系O中的表达，将k看作四维动量在参考系O中的表达，将φ(x)看作时空波函数在参考系O中的表达，将Φ(k)看作动量相空间波函数在参考系O中的表达；将x'看作时空坐标在参考系O'中的表达，将k'看作四维动量在参考系O'中的表达，将φ'(x')看作时空波函数在参考系O'中的表达，将Φ'(k')看作动量相空间波函数在参考系O'中的表达。参考系O'中的物理量与参考系O中的对应物理量由洛伦兹变换相联系。在这个联系中k·x, d^4x表现为标量，φ(x), Φ(k)表现为协变量。

定理1.2.1.  $\phi'(e^\varepsilon x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x) \Leftrightarrow \Phi'(e^\varepsilon k) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$

证明： $\phi'(e^\varepsilon x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x)$

$$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int_{x=-\infty}^{+\infty} \phi'(e^\varepsilon x) e^{-ik\cdot x} d^4x = \frac{i}{(2\pi)^{3/2}} \int_{x=-\infty}^{+\infty} e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x) e^{-ik\cdot x} d^4x$$

$$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int_{e^{-\varepsilon}x'=-\infty}^{+\infty} \phi'(x') e^{-ik e^{-\varepsilon}\cdot x'} d^4x' = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$$

$$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int_{x'=-\infty}^{+\infty} \phi'(x') e^{-ik e^{-\varepsilon}\cdot x'} d^4x' = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$$

$$\Leftrightarrow \Phi'(e^\varepsilon k) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k) \quad \square$$

以上定理表明，如果时空波函数是个协变量，那么其傅里叶展开系数全是同类型的协变量，反之亦然。以上结论从数学上看，等价于作一个变量代换 $x' = e^\varepsilon x, k' = e^\varepsilon k$ ，且满足 $\Phi'(e^\varepsilon x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(x)$ ，这个变换就是洛伦兹变换。

### 1.3 特殊函数的洛伦兹协变性

$$\text{推论1.3.1. } \int_{\vec{k}=-\infty}^{+\infty} \frac{1}{\omega} d^3\vec{k} = \int_{\vec{k}=-\infty}^{+\infty} \int_{E=-\infty}^{+\infty} \frac{1}{2\omega} [\delta(E-\omega) + \delta(E+\omega)] d^3\vec{k} dE = \int_{\vec{k}=-\infty}^{+\infty} \int_{E=-\infty}^{+\infty} \delta(E^2 - \omega^2) d^3\vec{k} dE \text{ (为标量)}$$

得到一个重要的数学技巧:  $\frac{1}{\omega} d^3\vec{k} = \delta(E^2 - \omega^2) d^3\vec{k} dE$ , 它是一个标量。有没有一个更直观的证据?

$$\text{推论1.3.7. } \delta(-k_a k^a - m^2) \text{ 为标量。}$$

$$\text{推论1.3.8. } \frac{1}{\omega} \delta(E-\omega), \frac{1}{\omega} \delta(E+\omega) \text{ 为标量。}$$

$$\text{推论1.3.9. } \delta^4(k' - k), \delta^4(x' - x) \text{ 为标量。}$$

## 2 粒子守恒协变量

$$\text{推论2.1.1. } Q = \int_{\vec{r}=-\infty}^{+\infty} \rho(\vec{r}, t_0) d^3\vec{r}, \quad \partial_a J^a(\vec{r}, t) = 0 \Rightarrow Q = \int_{\vec{r}=-\infty}^{+\infty} \int_{t=-\infty}^{+\infty} \partial_a [J^a(\vec{r}, t) U(t-t_0)] d^3\vec{r} dt$$

数学技巧：我这里只提供关键的技巧，并没有给出完整的证明。温伯格书中利用电流源守恒方程、物理函数在空间无穷远处为零和洛伦兹变换下物理时间前后不变的特性，从上面命题就可以证明  $Q, P^a, M^{ab}$  的洛伦兹协变性。

这里用了一种与一般书中不同的方法，采用了四维而非三维的傅里叶展开，清晰地展现出粒子离壳和在壳的物理概念，洛伦兹协变性也明显表现于其中，并且包含了狄拉克函数解的代数新解法。在证明的过程也看到了正能解和负能解的分解，并且负能解可以按两种含义进行理解，一是将负能解理解为一种负质量粒子，二是将负能解还是理解为正质量粒子，不过要理解为反射波，正能解理解为入射波。
