Minimal Fine Structure Constant Equation
Dwight Boddorf
A simple equation yielding a plausible fine structure constant is presented.

\[ x^{e+e} = \pi^{x-\frac{\pi}{[xx+1]+1/[xx]}} \]

\[ x > e \]
True if and only if
\[ xx = 137.03599920466 \ldots \]

As above, simplified with large integers given:

\[ x^{2e} = \pi^{x-\frac{\pi}{139+1/137}} \]

\[ x > e \]
True if and only if
\[ x^2 = 137.03599920466 \ldots \]
e = Euler’s number = 2.718 \ldots
\[ \pi = \text{Archimedes’ constant} \ 3.141 \ldots \]

Plausible value, simple equation and relevant constants make this guess worth sharing.
